ASCII MASTER FLOW — PANEL 1/12: Is it a geographical issue

```
ASK WHERE -> can the problem be located on a basin, coast, slope or corridor
ASK WHY THERE -> does terrain, climate, water or connectivity explain the location
ASK SO WHAT -> is there a spatial consequence such as migration, flooding or erosion
IF all three answer yes -> it is a geographical issue and the chain applies
IF only the policy dispute is present -> it is a governance question, not a spatial one
MUST REMEMBER: Contemporary Indian issues are spatial systems: regional inequality, urban
  stress, agrarian change, land degradation, water conflict, disasters, climate risk,
  coastal/Himalayan vulnerability, displacement and environmental justice emerge through
  hazard or pressure × exposure × vulnerability × governance.
```

ASCII MASTER FLOW — PANEL 2/12: Six issue-lenses

RESOURCE CONFLICT -> control of water, minerals, forests and coasts
BORDERLAND -> clustering near a frontier, gateway or corridor
HAZARD AND VULNERABILITY -> floodplain, coast, hill slope and seismic exposure
MOBILITY AND URBAN PRIMACY -> stress migration; drainage and land-market overload
ECOLOGICAL FRAGILITY -> coral island, wetland, delta and mountain ecosystems

ASCII MASTER FLOW — PANEL 3/12: Stress to policy chain

RESOURCE, CLIMATE OR TERRAIN STRESS -> the initiating physical condition
UNEVEN ACCESS OR EXPOSURE -> the stress falls unequally across space and groups
CONFLICT OR GOVERNANCE PRESSURE -> contestation becomes visible
SPATIAL SPILLOVER -> migration, flooding, erosion or corridor shift follows
POLICY RESPONSE -> instruments arrive, usually after the spillover

ASCII MASTER FLOW — PANEL 4/12: Nine-step analytical spine

```
PROCESS AND PATTERN -> name the process, then explain why there and not elsewhere
DRIVERS AND SCALE -> separate natural from human; fix local, regional or transboundary
EXPOSURE AND VULNERABILITY -> who is in the way; why the same hazard hurts unequally
TRADE-OFF -> name the genuine competing interest that always exists
INSTRUMENT AND VERDICT -> match the remedy to the mechanism, then grade the conclusion
```

ASCII MASTER FLOW — PANEL 5/12: Exposure and vulnerability separated

```
EXPOSURE -> population, assets and livelihoods physically in the hazard path
VULNERABILITY -> capacity to absorb, cope and recover from the same hazard
GROUNDWATER CASE -> smallholders lose access first because deeper wells need finance
FLOOD CASE -> informal housing without insurance or alternative shelter bears the loss
IMPLICATION -> physical protection alone leaves the distributional problem untouched
```

ASCII MASTER FLOW — PANEL 6/12: Scale mismatch rail

AQUIFER SCALE -> matches no administrative boundary in an irrigated plain
CATCHMENT SCALE -> extends beyond the municipal limit of a flooding city
BASIN SCALE -> crosses several states in a peninsular river dispute
CONSEQUENCE -> the unit expected to act cannot govern the whole process
ANSWER MOVE -> name the mismatch explicitly; it is the least used available insight

ASCII MASTER FLOW — PANEL 7/12: Groundwater decline worked chain

PROCESS -> abstraction exceeds recharge in an alluvial aquifer
PATTERN -> tube-well density, water-intensive cropping and assured procurement coincide
DRIVERS -> cropping pattern, energy pricing, procurement geography, rainfall variability
BURDEN -> smallholders unable to finance deeper wells lose access first
INSTRUMENT -> demand-side crop and energy reform with managed recharge at aquifer scale

ASCII MASTER FLOW — PANEL 8/12: Urban flooding worked chain

PROCESS -> runoff generation exceeds drainage conveyance capacity
PATTERN -> low-lying land, filled tanks and wetlands, encroached natural drains
DRIVERS -> surface sealing, undersized silted networks, floodplain construction
TRADE-OFF -> protecting drains and floodplains forgoes valuable developable land
INSTRUMENT -> drainage restoration, blue-green infrastructure and tenure-backed relocation

ASCII MASTER FLOW — PANEL 9/12: Current-material discipline

FORECAST vs OBSERVATION -> a prediction is not a recorded measurement
PROJECTION vs MEASUREMENT -> a model output is not an instrument reading
SURVEY vs CENSUS -> a sample estimate is not an enumerated count
ANNOUNCEMENT vs IMPLEMENTATION -> approval is not delivery on the ground
TARGET vs ACHIEVEMENT -> a stated goal is never a completed outcome

ASCII MASTER FLOW — PANEL 10/12: Peninsular basin dispute geography

```
UPSTREAM STORAGE -> reservoir location and timed release govern downstream availability
INTER-STATE SPREAD -> Maharashtra, Karnataka, Telangana and Andhra Pradesh all matter
COMMAND AREAS -> irrigated agriculture depends on predictable release windows
LOWER BASIN -> delta and lower-riparian needs fear reduced seasonal flow
ADMINISTRATION -> bifurcation reorganised the basin's management, not its geometry
CLOSE DISTINCTION: Hazard differs from disaster, scarcity from access failure, drought from
  aridity, degradation from desertification, climate trend from single event, mitigation from
  adaptation, and project approval, construction and operation are separate status stages.
```

ASCII MASTER FLOW — PANEL 11/12: Fragile-edge development trade-off

```
GREAT NICOBAR ADVANTAGE -> proximity to east-west routes and the Malacca-facing arc
GREAT NICOBAR CONSTRAINT -> coral coast, tribal habitat, seismicity, coastal regulation
NORTH-EAST ADVANTAGE -> Bay of Bengal access bypassing the narrow mainland hinge
NORTH-EAST CONSTRAINT -> folded slopes, heavy monsoon, landslides, forest fragmentation
RULE -> route value and ecological fragility occupy the same site, so name the trade-off
EVIDENCE LIMIT: Joshimath/Himalayan towns, Delhi air basin, Bengaluru/Chennai water stress,
  Marathwada drought, Punjab groundwater, Bundelkhand, Sundarbans, Western Ghats, mining belts
  and inter-state river disputes show scale-specific causation; current claims require IMD,
  Census, CWC, CGWB, ISRO, MoEFCC or other official source-date-status labels.
```

ASCII MASTER FLOW — PANEL 12/12: Dated official anchors and their boundary

```
21 AUG 2025 -> PIB and Lok Sabha reply on continued Krishna tribunal relevance
29 JUL 2024 -> PIB release on urban flooding during the monsoon season
READING -> both anchors illustrate processes already owned by core files
AMRUT -> storm-water and water-body interventions cited in the flooding release
BOUNDARY -> no allocation share, rainfall total or outlay is quoted from memory
```
