MCQ 1

In the syllabus item "Quine and Strawson", which pairing correctly matches each philosopher to his project?

A. Quine - critique of empiricism, and Strawson - theory of basic particulars and persons. B. Quine - theory of basic particulars and persons, and Strawson - critique of empiricism. C. Both jointly propose a single naturalized theory of persons. D. Quine develops descriptive metaphysics, and Strawson replaces epistemology with naturalized psychology.

MCQ 2

What single target do Quine and Strawson share, despite their different methods?

A. Classical and logical empiricism, especially atomistic verification. B. Kantian transcendental idealism and its defence of synthetic a priori cognition. C. Hegelian absolute idealism and its dialectical account of conceptual development. D. Aristotelian substance metaphysics and its doctrine of primary substances.

MCQ 3

Which statement best captures the methodological contrast between the two thinkers?

A. Both primarily use transcendental arguments to establish necessary conditions of objective experience. B. Quine makes philosophy continuous with science, and Strawson practises descriptive metaphysics. C. Both treat philosophy as continuous with empirical science and reject autonomous conceptual analysis. D. Quine is a descriptive metaphysician, and Strawson is a naturalist.

MCQ 4

The claim "Quine reforms empiricism from within while Strawson rejects its starting point" means that:

A. Quine retains empirical constraint, unlike Strawson's rejection of the private given. B. Both abandon empiricism as irredeemable and ground knowledge in rationalist first principles. C. Both take private sense-data as the basic given. D. Quine denies that experience is any check on belief.

MCQ 5

Quine's precise conclusion about the analytic/synthetic distinction is that:

A. There is no principled, non-circular criterion marking off a class of analytic truths. B. No sentence has ever appeared analytic to any competent speaker. C. All meaningful sentence is analytic once translated into canonical logical notation. D. Analyticity is identical with logical truth and therefore needs no account of synonymy.

MCQ 6

Interchangeability *salva veritate* fails to define synonymy because:

A. It is explicitly defined in terms of definition, which is circular. B. It cannot be expressed in any formal language. C. It already presupposes translation indeterminacy, so synonymy cannot be compared across languages. D. Coextensive terms interchange extensionally, and adding necessity presupposes analyticity.

MCQ 7

Quine regards the appeal to "semantic rules" in an artificial language as inadequate because such rules:

A. They generate contradictions whenever an artificial language classifies a sentence as analytic. B. They merely stipulate which sentences count as analytic and leave analyticity itself unexplained. C. They cannot be formulated for artificial languages without presupposing natural-language meaning. D. They presuppose a completed radical-translation manual before analyticity can be stipulated.

MCQ 8

The Grice-Strawson reply "In Defence of a Dogma" (1956) contends that:

A. Quine conclusively proved the distinction to be unreal. B. Synonymy can be defined without residue by unrestricted interchangeability *salva veritate*. C. A distinction with agreed use and clear examples is not discredited merely by the absence of a reductive definition. D. Analyticity is identical with empirical verifiability, so agreed usage cannot defend it.

MCQ 9

The second dogma, reductionism, is the belief that:

A. All statements are analytic once the total language is regimented into canonical notation. B. Reductionism says that word meaning is exhausted by linguistic use, and that each sentence inherits confirmation from established communal practice rather than immediate experience. C. Reference is inscrutable, so individual statements cannot possess determinate confirmation conditions. D. Each meaningful statement is equivalent to a logical construction upon terms referring to immediate experience, with its own range of confirming experiences.

MCQ 10

In Quine's metaphor, the "web of belief" meets experience:

A. The web meets experience sentence by sentence, with each claim independently confirmed or refuted. B. Only as a corporate body, and only at its edges / boundary conditions. C. The web not meets experience, because observation has no evidential role in Quine's naturalism. D. The web meets experience only through an unrevisable class of analytic statements.

MCQ 11

"No statement is immune to revision" implies, for Quine, that:

A. The laws of logic are the one exception and cannot be revised. B. Only observation sentences are revisable, and central logical and mathematical claims remain immune. C. Even the laws of logic could in principle be revised to conserve the rest of the system. D. Only analytic truths are revisable, since synthetic claims are fixed directly by experience.

MCQ 12

The contrast between "central" and "peripheral" statements in the web is one of:

A. Central and peripheral statements differ in practical entrenchment, not in unrevisable kind. B. Central statements are true, and peripheral statements become false whenever experience conflicts. C. Centrality vindicates the analytic-synthetic division as a sharp distinction within Quine's own theory. D. Central statements are meaningful, and peripheral statements become meaningless under recalcitrant experience.

MCQ 13

Given $(H \ \& \ A) \rightarrow O$ and not-O, what is the strongest conclusion licensed by modus tollens in the Duhem-Quine setting?

A. The focal hypothesis H alone is false, regardless of whether any auxiliary assumption is retained. B. The auxiliary assumptions A alone are false, so the focal hypothesis H remains confirmed. C. H and A cannot both be retained, and not-O does not show which conjunct must be revised. D. Both H and A are confirmed because the failed observation leaves the theoretical package untouched.

MCQ 14

How do Duhem's and Quine's versions of the thesis differ?

A. Duhem and Quine give the thesis exactly the same scope, including logic and mathematics. B. Quine restricts it to physics and Duhem extends it to all knowledge. C. Duhem restricts the thesis to physics, and Quine extends holism to science as a whole, including logic. D. Both exempt logic and mathematics, limiting underdetermination to empirical hypotheses and auxiliaries.

MCQ 15

The Neptune and Vulcan episodes together illustrate that:

A. Revising an auxiliary is invariably the correct response to an anomaly. B. Revising the deep law is invariably the correct response. C. Newtonian mechanics is unrevisable in principle, so anomalies must invariably be assigned to auxiliaries. D. Neptune prompted auxiliary revision, Mercury deep-law revision, and logic fixes neither.

MCQ 16

Popper's response to the Duhem-Quine point is best described as:

A. Popper denies the logical force of the Duhem-Quine problem and treats isolated hypotheses as conclusively falsifiable. B. Popper accepts the thesis as establishing sceptical relativism and abandons methodological rules for theory choice. C. Popper accepts the logical problem and treats falsification as a methodological decision that forbids ad hoc rescues. D. A reduction of scientific method to individual psychology.

MCQ 17

In the "Gavagai" scenario, why can the field linguist not settle whether the term means "rabbit" or "undetached rabbit-parts"?

A. Radical translation fails because native speakers withhold assent and deliberately frustrate behavioural testing. B. Rapid rabbit movement prevents sufficiently stable observation to discriminate among rival translation manuals. C. Both manuals fit stimulus meaning, and behavioural evidence does not fix the required apparatus of individuation. D. Reference remains unsettled only because the linguist lacks a bilingual dictionary linking native terms to English objects.

MCQ 18

"Inscrutability of reference" and "indeterminacy of translation" are related in that:

A. Inscrutability concerns the reference of terms, and it supports the wider indeterminacy among whole translation manuals. B. They are interchangeable names for the same claim that reference and translation lack determinate content. C. The theses are opposed: inscrutability fixes term-reference uniquely, and translation indeterminacy denies any acceptable whole-sentence manual. D. Both theses eliminate stimulus meaning altogether, so assent and dissent place no constraint on translation.

MCQ 19

Which premise does Quine himself acknowledge as driving the indeterminacy argument in the special case of language?

A. Innate meanings supplied by rationalist psychology determine which translation manual is correct. B. Cartesian substance dualism explains why public behaviour cannot reveal a speaker's private meanings. C. Behaviourism about the evidence for meaning - in linguistics, he says, "one has no choice". D. The analytic-synthetic distinction guarantees determinate synonymy across rival translation manuals.

MCQ 20

Chomsky's objection to the indeterminacy of translation is that:

A. Meanings are Platonic abstract objects that select one correct translation independently of behaviour. B. Indeterminacy is merely the ordinary underdetermination of theory by evidence that also affects physics, so Quine owes a special argument for treating meaning worse than physical theory. C. Translation is fully determinate whenever all observable verbal dispositions have been recorded. D. Stimulus meaning is incoherent, so no behavioural evidence can constrain translation at all.

MCQ 21

Quine's criterion of ontological commitment is captured in the slogan:

A. "To be is to be perceived," because ontology reduces to the contents of experience. B. "The meaning of a word is its use," because ontological commitment follows ordinary linguistic practice. C. "To be is to be the value of a bound variable," from "On What There Is," published in 1948. D. "Existence is a real predicate," because quantified theory attributes existence as an ordinary property.

MCQ 22

"Naturalized epistemology" is Quine's proposal that:

A. Epistemology becomes a branch of ethics concerned chiefly with prescribing duties of belief. B. Naturalized epistemology concedes global scepticism and treats knowledge as impossible in principle. C. Epistemology becomes empirical psychology rather than an a priori foundation for science. D. Only a priori methods can yield genuine knowledge.

MCQ 23

"Ontological relativity" is the thesis that:

A. All ontology is equally unacceptable, since reference cannot be fixed relative to any background language. B. What a theory is about is determinate only relative to a background language or translation manual. C. Ontology is fixed absolutely by formal logic, independently of all background language or translation manual. D. Ontological relativity implies that no objects exist, even relative to a background theory or language.

MCQ 24

The convergence between Quine and the later Wittgenstein is best stated as:

A. Quine and Wittgenstein reject private meanings through indeterminacy and meaning-as-use respectively. B. Both defend a principled analytic-synthetic distinction against verificationist reductions of meaning. C. Both are foundationalists who seek an unrevisable basis for knowledge outside ordinary inquiry. D. Both accept private ostensive definition as sufficient to fix the meaning of sensation terms.

MCQ 25

For Strawson, a "basic particular" is one that:

- A. A basic particular is metaphysically simple, indivisible and indestructible in the manner of a substance. B. Is a private sense-datum given in immediate experience. C. A basic particular exists with absolute necessity and belongs to all possible worlds. D. A basic particular can be identified independently of first identifying another particular.

MCQ 26

Strawson's argument that material bodies are basic turns crucially on:

- A. Material bodies are basic because their causal powers produce sensations more directly than other particulars. B. Objective thought requires re-identification within one public spatio-temporal system of material bodies. C. Material bodies are basic because they are the objects most immediately given in private perception. D. Material bodies are basic because infinite divisibility supplies an unlimited basis for identification.

MCQ 27

The "no-space" (purely auditory) world thought experiment is designed to show that:

- A. Sounds themselves are basic particulars because auditory recurrence requires no spatial framework. B. The thought experiment proves that objective experience is impossible in all non-spatial worlds. C. The auditory world permits re-identification solely by constructing a space-analogue, which confirms the need for a spatio-temporal framework. D. The thought experiment shows that space is a subjective illusion imposed upon purely auditory experience.

MCQ 28

"Descriptive" as opposed to "revisionary" metaphysics is best defined as metaphysics that:

- A. Descriptive metaphysics rejects metaphysics and confines philosophy to piecemeal linguistic clarification. B. Constructs an ideal logical language to replace ordinary speech. C. Lays bare the actual structure of our conceptual scheme rather than proposing a better one. D. Revises ordinary concepts to suit the needs of natural science.

MCQ 29

To call the concept of a person "primitive" is to hold that it is:

- A. Calling person primitive means the concept is vague, pre-scientific and destined for theoretical replacement. B. The concept of a person cannot be analysed into a pure ego plus a body and is logically prior to both. C. The concept of a person is innate and fully present in the mind before any public

identification. D. The concept of a person is identical with that of a biological organism described only physically.

MCQ 30

P-predicates differ from M-predicates in that P-predicates are:

- A. P-predicates apply only to inanimate material bodies and describe their publicly observable properties.
- B. P-predicates are confined to weight, shape and spatial location, just like M-predicates.
- C. P-predicates can not be self-ascribed and are known only by observing another person's behaviour.
- D. P-predicates are ascribed to others through behavioural criteria, and their self-ascription is non-observational.

MCQ 31

The core premise of Strawson's argument for the primitiveness of the person is that:

- A. The body causally produces the mind, making person a compound of two independently identifiable substances.
- B. Experiences are strictly unowned events, so the concept of a subject can be eliminated without loss.
- C. Only one's own mind is knowable, so self-ascription requires no capacity to identify other persons.
- D. Self-ascription of P-predicates is possible only if one can also ascribe them to others.

MCQ 32

Strawson refutes the "no-ownership" theory by arguing that it:

- A. The theory covertly reintroduces ownership when it speaks of experiences depending on 'my' body.
- B. The no-ownership theory fails because empirical neuroscience shows that all experience has a bodily cause.
- C. The no-ownership theory fails because it conflicts with Cartesian substance dualism's separation of mind and body.
- D. The no-ownership theory fails because private ownership claims cannot be verified through public observation.

MCQ 33

In "On Referring" (1950), Strawson's central objection to Russell is that Russell:

- A. Russell denies the existence of definite descriptions as meaningful grammatical expressions.
- B. Russell already accepts truth-value gaps whenever a definite description lacks a referent.
- C. Russell rejects formal logic and analyses descriptions only through ordinary conversational practice.
- D. Russell confuses sentence meaning with a speaker's act of referring on an occasion.

MCQ 34

On Strawson's account, "The present King of France is bald" (there being no such king) is:

A. The utterance is straightforwardly true because no existing king can falsify the predicate. B. Neither true nor false, because a presupposition of the referring use fails. C. Does not hold, because the sentence asserts a uniquely existing king and that fails. D. The sentence-type is literally meaningless once its attempted reference lacks an object.

MCQ 35

For Russell's Theory of Descriptions ("On Denoting", 1905), the same empty-subject sentence is:

A. The sentence is false because its asserted unique existence condition fails. B. The sentence is neither true nor false because Russell treats existence as a presupposition. C. The sentence is true by default because no unique king exists to instantiate baldness. D. The sentence exhibits presupposition failure rather than the failure of an asserted uniqueness condition.

MCQ 36

Strawson counts as a "critic of empiricism" (the syllabus phrase) chiefly because he argues that:

A. Strawson criticizes empiricism chiefly for making philosophy excessively mathematical and formally regimented. B. Public spatio-temporal identification is prior to any alleged private sense-datum. C. Strawson holds that private sense-data are the only reality and therefore the foundation of identification. D. Strawson argues that induction becomes deductively valid once observations are placed in public space-time.

MCQ 37

The central disagreement between Quine and Strawson is best framed as whether the conceptual scheme is:

A. The dispute concerns whether the conceptual scheme is simply true or false as one undivided theory. B. The decisive issue is whether the whole conceptual scheme can be expressed in first-order logic. C. Quine treats the scheme as holistically revisable come what may, and Strawson treats a public framework as an indispensable precondition of objective thought. D. The disagreement turns on whether either conceptual scheme permits rational belief in God's existence.

MCQ 38

Which of the following is a genuine convergence between Quine and Strawson?

A. Both accept a robust analytic-synthetic distinction as the foundation of empiricist epistemology. B. Both are revisionary metaphysicians who replace ordinary language with ideal logical systems. C. Both deny that experience constrains belief in any way. D. Both reject a private inner object as the anchor of meaning, making the public / holistic basic.

MCQ 39

Treating Quine and Strawson as "basically agreeing" is a trap because they in fact differ on:

A. They differ on nothing philosophically important once their shared rejection of private givens is recognized. B. Their disagreement concerns terminology alone, since naturalism and descriptive metaphysics name the same method. C. Their central dispute is whether persons exist at all within an acceptable ontology. D. They differ over revisability, meaning and the contrast between naturalist and descriptive methods.

MCQ 40

The recommended "graded" closing position on the revisable-versus-indispensable question is that:

A. The entire conceptual scheme is uniformly revisable, with no difference in practical resistance among its statements. B. Peripheral claims are readily revisable, and some public framework for re-identifiable subjects remains practically indispensable, and the defensible verdict is layered. C. The entire conceptual scheme is fixed and unrevisable, including peripheral empirical classifications. D. The revisable-versus-indispensable question is meaningless because conceptual schemes cannot be compared or evaluated.

MCQ 41

Which attribution observes correct provenance discipline?

A. The bound-variable slogan first appears in "Two Dogmas of Empiricism," published in 1951. B. Quantum logic was proposed jointly by Hilary Putnam and Garrett Birkhoff in 1936. C. Duhem himself extended the underdetermination thesis to all knowledge, including logic. D. The bound-variable slogan comes from Quine's 1948 essay "On What There Is."

MCQ 42

A common error states Quine's conclusion as "no sentence is really analytic." The accurate statement is that:

A. All sentences become synthetic once no analytic class can be identified by a non-circular criterion. B. Statements commonly called analytic are untenable and should be removed from a rational language. C. Analyticity is identical with necessity by definition, so synonymy needs no further explanation. D. No non-circular criterion marks off analytic truths, even if familiar examples remain.

MCQ 43

Davidson's "Radical Interpretation" (1973) is often confused with Quine's project. Correctly, it:

A. Radical interpretation differs from translation and treats residual indeterminacy as harmless. B. Radical interpretation is identical to Quine's radical translation in method, evidence and philosophical conclusion. C. Davidson rejects all indeterminacy of meaning and aims to recover a uniquely correct interpretation. D. Davidson denies that linguistic meaning is public and grounds interpretation in private mental objects.

MCQ 44

A frequent mistake is to call Strawson's descriptive metaphysics "anti-metaphysical." Correctly, it:

- A. Descriptive metaphysics rejects conceptual analysis and abandons inquiry into the structure of thought.
- B. Is itself metaphysics - it describes the actual structure of our conceptual scheme instead of revising it.
- C. Descriptive metaphysics constructs an ideal logical language to replace the distortions of ordinary speech.
- D. Descriptive metaphysics denies that persons are basic particulars within our conceptual scheme.

MCQ 45

"In Defence of a Dogma" (1956), which defends the analytic/synthetic distinction against Quine, was written by:

- A. P. F. Strawson alone, as a defence of his own account of ordinary usage.
- B. H. P. Grice and P. F. Strawson, writing as joint defenders of the distinction.
- C. W. V. Quine and Rudolf Carnap, as a shared defence of logical empiricism.
- D. Bertrand Russell and P. F. Strawson, continuing their debate over descriptions.

MCQ 46

Strawson's use of behavioural criteria for P-predicates commits him to the view that:

- A. P-predicates simply mean behavioural patterns and therefore support logical behaviourism.
- B. Behavioural criteria eliminate mental predicates by translating all psychological ascription into physical description.
- C. Cartesian dualism is correct because behavioural criteria connect an observable body with a separately identifiable mind.
- D. Behaviour is criterial evidence for P-predicates, not their meaning.

MCQ 47

On the empty-subject sentence, the Russell/Strawson split is correctly stated as:

- A. Both Russell and Strawson treat the sentence as neither true nor false when the referent is absent.
- B. Both treat the sentence as false because no present King of France satisfies the description.
- C. Russell treats the sentence as true, and Strawson treats the attempted assertion as false.
- D. Russell calls it false, and Strawson says failed reference prevents ordinary assertion.

MCQ 48

How should Quine's early claim that even logical laws are revisable be qualified by his later philosophy of logic?

A. Quine consistently treats all logical laws as experimentally disposable whenever one anomalous observation appears. B. The later qualification restores an unrevisable analytic class and withdraws confirmation holism altogether. C. Later Quine qualifies revisability through minimum mutilation and the risk of changing the subject. D. Quine transfers the authority to revise logic from scientific practice to Strawson's descriptive metaphysics.

MCQ 49

What is the safest statement of the Quine-Putnam indispensability line within Quine's account of ontological commitment?

A. Indispensability proves that all nouns in successful science name an independently existing abstract object. B. Quine's taste for desert landscapes requires nominalism even when mathematics is indispensable to physical theory. C. The argument bypasses regimentation because ontological commitment can be read directly from ordinary grammar. D. Scientific indispensability can support commitment to abstract entities quantified over by our best theory, and the broader argument extends beyond Quine's bound-variable slogan.

MCQ 50

What do proxy functions show in Quine's discussion of reference and ontology?

A. All terms have one absolute referent fixed before any background theory or translation manual is adopted. B. Proxy functions prove that rival scientific theories can not be empirically equivalent at the sentence level. C. Systematic reinterpretations can permute objects and preserving sentence-level truth, reinforcing the relativity or inscrutability of reference. D. They provide Strawson's criterion for identifying persons through psychological predicates alone.

MCQ 51

Which distinction prevents Quinean underdetermination from being identified automatically with indeterminacy of translation?

A. Underdetermination concerns rival theories compatible with evidence, and translation indeterminacy adds the naturalistic claim that no further semantic fact selects among manuals. B. Underdetermination applies only to logic, and translation indeterminacy applies only to sensory observation sentences. C. Translation indeterminacy is weaker because it assumes one uniquely correct manual that the available evidence has failed to discover. D. The two doctrines are identical by definition and Quine offers no proposed asymmetry between physics and semantics.

MCQ 52

How does Strawson connect the subject-predicate framework with his theory of basic particulars?

A. Subject-predicate form is discarded because only feature-placing sentences can express objective claims. B. Predicates identify themselves without any framework of demonstrative reference or re-identification. C. Ordinary predication depends on publicly identifying a basic particular as its subject. D. The framework proves that all grammatical subjects denote an immaterial Cartesian substance.

MCQ 53

What is the relation between identification and re-identification in Strawson's argument for material bodies?

A. Objective identification requires the possibility of tracing the same particular through one spatio-temporal framework, so re-identification is a condition of robust identification. B. Identification is momentary acquaintance, and re-identification is an optional memory exercise with no bearing on objectivity. C. Re-identification applies only to private sensations because public bodies are immediately self-identifying. D. The two notions are interchangeable names for Russell's quantified analysis of definite descriptions.

MCQ 54

How does Strawson's primitive concept of a person address the problem of other minds?

A. Other minds are known by deductively proving that each visible body contains an unobservable ego. B. Psychological predicates are other-ascribed through public criteria and self-ascribed non-observationally, avoiding an inference to hidden Cartesian minds. C. The problem disappears because P-predicates are reducible without remainder to movements of material bodies. D. Self-ascription is prior and intelligible even if predicates of consciousness can not apply to anyone else.

MCQ 55

What role do uniqueness and context play in Strawson's critique of Russell's theory of descriptions?

A. A description can identify a contextually salient individual rather than assert Russell's full existence-and-uniqueness analysis as the conversational point. B. Context eliminates all uniqueness condition because definite descriptions invariably function as proper names. C. Strawson denies that speakers ever use descriptions referentially on particular occasions. D. Uniqueness alone guarantees successful reference even when the existence presupposition plainly fails.

MCQ 56

Which formulation accurately distinguishes presupposition failure, falsehood and meaning in Strawson's original 'On Referring' account?

A. The sentence-type remains meaningful, and an unsuccessful referring use ordinarily fails to make a true-or-false assertion when its existence presupposition is unmet. B. The sentence becomes meaningless because all unsupported presuppositions destroy the grammar of the expression. C. The use is straightforwardly incorrect for exactly Russell's reason that unique existence is asserted. D. The use becomes true by default because no existing object can falsify the predicate applied.

MCQ 57

What is the central normative objection to Quine's naturalized epistemology?

A. Naturalized epistemology is too normative because it refuses all empirical description of human cognition. B. A causal account may describe how sensory input produces belief and still fail to explain which beliefs or methods ought to be accepted. C. The programme fails only because psychology cannot investigate perception or language acquisition scientifically. D. Quine retains an external Cartesian foundation and therefore duplicates traditional first philosophy.

MCQ 58

What is the strongest limitation of Strawson's descriptive metaphysics as a metaphysical method?

A. Descriptive metaphysics can map indispensable features of our scheme, and this does not prove unique correctness, unrevisability or correspondence with mind-independent reality. B. It is self-defeating because description necessarily eliminates all concepts used in ordinary thought. C. It supplies a complete causal explanation of how material bodies generate states of consciousness. D. It becomes revisionary whenever it identifies a condition of possible reference or objective thought.

MCQ 59

How should Strawson's 'Freedom and Resentment' and reactive attitudes be handled in this printed syllabus item?

A. Reactive attitudes replace the concept of a person and therefore form the sole core of Strawson's syllabus ownership. B. They belong to Quine's naturalized epistemology because resentment is a behavioural disposition. C. They establish the analytic-synthetic distinction defended jointly by Quine and Strawson. D. They are source-recognized bounded enrichment, not a substitute for the printed theories of basic particulars and persons or an independently routed PYQ demand.

MCQ 60

Which comparison keeps Quinean naturalism and holism distinct from Strawsonian descriptive metaphysics?

A. Both philosophers reduce philosophy to experimental psychology and reject all framework conditions of reference. B. Quine places inquiry inside revisable science, and Strawson maps our conceptual framework rather than treating that map as natural science. C. Strawson's web of belief naturalizes

epistemology, and Quine's basic particulars describe ordinary language. D. Their methods are interchangeable because both defend the same analytic-synthetic distinction against logical positivism.

MCQ 61

What is the most defensible overall relation between Topic 11 and Logical Positivism or Russell and early Wittgenstein?

A. Topic 11 owns Quine's critique and Strawson's rival analyses, and the positive systems of verificationism, descriptions and logical atomism remain cross-links owned by Topics 07 and 06. B. Quine and Strawson jointly own the entire Vienna Circle programme and Russell's logical atomism. C. All criticism of verification or descriptions transfers the original doctrine into Topic 11 ownership. D. Cross-links must be removed because neighbouring analytic philosophers cannot illuminate one another.
