DETAILED SOLUTIONS / ANSWER KEY | Time: 3 Hours | Maximum Marks: 250

SECTION A

1. Silence may preserve peace for a day and injustice for a generation.

Working thesis: Silence buys immediate calm at compounding cost. What is not named cannot be remedied, and an unremedied wrong hardens into custom that later generations struggle even to recognise as wrong. The proposition contrasts the short-run value of quiet with the long-run price of a normalised injury.

Structure: Distinguish prudent restraint from complicit silence. | Show how unspoken wrongs acquire the authority of tradition. | Trace speech that changed law, from social reform to workplace rights. | Concede the genuine value of timing and confidentiality in negotiation and communal tension. | Offer a test for the point at which silence becomes complicity.

Dimensions: Moral courage is costly and unequally distributed, since whoever is best placed to see a wrong is often least able to survive reporting it. | Reform movements converted private suffering into public argument, which is why testimony almost always precedes remedial legislation. | Diplomatic quiet can protect negotiations and lives, yet permanent silence about atrocity signals that violation carries no reputational price. | Law responds to articulated harm, so an injury lacking a public name possesses neither a remedy nor even a statistic.

Examples: The Vishaka guidelines of 1997 followed Bhanwari Devi's refusal to stay silent about sexual violence at work. | Satyendra Dubey's murder in 2003 after exposing highway corruption led towards whistle-blower protection legislation in 2014. | Rammohan Roy's public campaign against sati showed reform requiring open argument rather than private moral discomfort. | The Protection of Children from Sexual Offences Act, 2012 made reporting a legal duty instead of a personal choice.

Counterinterview: Speech is not automatically just. Premature disclosure has collapsed hostage negotiations, and public accusation without evidence has destroyed innocent reputations and inflamed communal violence. Rumour amplified as courage kills. The defensible claim is narrower: silence is culpable when it shields the powerful, and prudent only when it shields the vulnerable.

Conclusion: Judge silence by its beneficiary. Quiet that protects a perpetrator or an institution is complicity dressed as civility; quiet that protects a survivor or an ongoing remedy may be the braver choice.

Model framework for practice; it is not an official or unique UPSC answer.

2. The value of knowledge lies partly in knowing its limits.

Working thesis: Knowledge grows dangerous when it forgets its own boundary conditions. A model trained on one context, a statistic collected for one purpose, or an expert judgement offered beyond its field carries the authority of evidence without its warrant. Knowing the limit is therefore part of the knowledge, not a concession made against it.

Structure: Explain that every finding carries a domain of validity. | Show forecasting failures as boundary failures rather than mere arithmetic errors. | Examine expert advice in government and the problem of unstated assumptions. | Discuss decision-making under uncertainty through precaution and revisability. | Warn against the opposite error of dismissing expertise altogether.

Dimensions: Scientific claims remain conditional on method, sample and context, so transferring them across settings silently changes what is being asserted. | Governance must decide before evidence matures, which makes stated assumptions and a review date part of honest technical advice. | Expertise deserves weight without deference, because specialists share the incentives, blind spots and institutional interests of their own field. | Uncertainty is manageable through precaution, staged commitment and reversible choices rather than through a performance of confidence.

Examples: Early COVID-19 projections in 2020 varied enormously, and policy improved once models were published with assumptions and ranges. | Vellore Citizens Welfare Forum (1996) read the precautionary principle into Indian environmental jurisprudence. | Environmental impact assessments lose credibility when project proponents commission the studies establishing acceptable risk. | Groundwater estimates based on average recharge concealed local exhaustion across Punjab and parts of western India.

Counterinterview: Excessive humility is exploited. Regulated industries routinely amplify residual uncertainty to postpone action, and officials invoke complexity to escape accountable choice, while citizens need usable guidance rather than hedged prose. Acknowledging limits must therefore accompany a clear recommendation, a named decision-maker and a date for reconsideration.

Conclusion: Mature knowledge states what it knows, what it assumes and what would falsify it. In public life that discipline converts expertise from an authority claim into an accountable input citizens can weigh for themselves.

Model framework for practice; it is not an official or unique UPSC answer.

3. Identity is a home when open, and a prison when sealed.

Working thesis: Belonging supplies language, memory and the confidence to act, which is why identity functions as a home. It becomes confinement once membership is policed, exit is punished and the group's boundary matters more than its members' freedom. The proposition measures identity by whether a person may leave it, question it or combine it.

Structure: Establish the enabling functions of belonging. | Identify what seals an identity: policed exit, internal hierarchy, external threat. | Test India's federal and constitutional accommodation of plural identity. | Examine migration, where identity travels but entitlements often do not. | Conclude on rights of exit and overlapping membership.

Dimensions: Culture supplies usable competence and confidence, since language, craft and ritual are resources a person actually deploys in daily life. | Pluralism sustains common citizenship without demanding uniformity, provided group authority never overrides an individual's constitutional rights. | Nationalism becomes civic or exclusionary depending on whether membership rests on allegiance to shared institutions or on ascribed descent. | Migration tests openness, because domicile rules, language and documentation decide whether a newcomer is treated as citizen or guest.

Examples: The States Reorganisation Act, 1956 accommodated linguistic identity within the Union instead of treating it as incipient secession. | The Sixth Schedule and Article 371 provisions protect distinct tribal and regional arrangements inside one constitutional framework. | One Nation One Ration Card portability lets a migrant claim food entitlements outside her home state. | The Eighth Schedule's recognition of twenty-two languages supports plural public life without displacing shared civic identity.

Counterinterview: Openness is often demanded only of the weak. Small linguistic and tribal communities that dissolve their boundaries frequently lose land, language and bargaining power to a dominant culture that never opens itself in return. Some closure is protective, and constitutional safeguards exist precisely to secure it for vulnerable groups.

Conclusion: A defensible identity is one a member could revise without exile and a stranger could enter without humiliation. India's constitutional design aims at exactly that combination of protection without imprisonment.

Model framework for practice; it is not an official or unique UPSC answer.

4. Care is an economic infrastructure hidden in private life.

Working thesis: Every worker who reaches an office was fed, nursed and raised by labour national accounts never priced. Care qualifies as infrastructure because output collapses without it, yet it is classified as affection rather than production and its cost is charged silently to women. The proposition reclassifies a private duty as a public input.

Structure: Show that care meets the functional definition of infrastructure. | Explain how measurement failure produces policy failure. | Connect the care burden to women's employment and health outcomes. | Consider public provision, workplace design and social security responses. | Address the risk of professionalising care badly.

Dimensions: Time-use evidence shows unpaid domestic and care work absorbing a large share of women's day, directly constraining paid employment and rest. | Female labour force participation responds to childcare, eldercare and safe transport at least as strongly as it responds to wages or training. | Health systems quietly depend on family caregivers for nursing, medication adherence and rehabilitation after a patient is discharged. | Social policy can socialise part of the burden through creches, parental leave, old-age support and decent wages for care workers.

Examples: India's Time Use Survey of 2019 recorded women spending far more time than men on unpaid domestic work. | MGNREGA's worksite creche requirement recognises childcare as a condition of women's participation in public works. | Accredited Social Health Activists perform community health duties for honoraria rather than regular wages and benefits. | The Maternity Benefit Amendment Act, 2017 extended paid leave while concentrating the cost on formal-sector employers.

Counterinterview: Treating care as infrastructure invites two errors. Marketised care can become low-paid, insecure work performed largely by poorer women for wealthier households. And measuring care does not redistribute it: without men's participation and enforceable employer obligation, valuation may simply add statistics to an unchanged burden.

Conclusion: The practical test is whether caring costs a woman her job. Creches, portable entitlements, decent pay for care workers and shared domestic responsibility would turn a hidden subsidy into a recognised, financed public input.

SECTION B

5. India's demographic future depends more on capability than on numbers.

Working thesis: A young population is an opportunity only where the young can read, stay healthy, find productive work and choose their own lives. Numbers create potential; capability converts it into output and freedom. The proposition locates India's demographic outcome in classrooms, clinics and workplaces rather than in population arithmetic.

Structure: State the demographic window and its finite duration. | Show foundational learning and nutrition as the binding constraints. | Analyse the gap between educational attainment and productive employment. | Treat women's participation as the largest unused capability. | Note sharp divergence across states within one national transition.

Dimensions: Foundational literacy and numeracy determine whether additional years of schooling yield competence or merely accumulate certificates. | Nutrition and anaemia shape cognition and stamina, making health spending an economic policy rather than only a welfare transfer. | Employment quality matters more than headcount, since informal low-productivity work cannot absorb rising educational aspiration. | Women's low participation withholds nearly half the potential workforce, turning safety, care support and social norms into macroeconomic variables.

Examples: ASER surveys have repeatedly found many rural children in higher grades unable to read a Standard II text. | NIPUN Bharat, launched in 2021, targets foundational literacy and numeracy as a measurable national mission. | Kerala's early investment in schooling and public health preceded both its demographic transition and its human development record. | National Family Health Survey rounds show persistent anaemia among adolescent girls and women of reproductive age.

Counterinterview: Capability without demand becomes frustration. Better-trained graduates entering a slow-growing labour market produce educated unemployment and out-migration, as several Indian states already show. Skilling cannot substitute for manufacturing, urban services and small-firm growth, so supply-side capability and demand-side investment must advance together.

Conclusion: India's advantage is temporary and unevenly spread across states. Whether it becomes a dividend depends on foundational learning, women's employment and job creation arriving before the working-age share begins to shrink.

Model framework for practice; it is not an official or unique UPSC answer.

6. Climate resilience is a test of federalism as much as of technology.

Working thesis: Panels, forecasts and flood models are necessary but inert without a government close enough to act on them. A warning must become an evacuation and heat data must become a changed work schedule, and those conversions happen in districts and wards. The proposition relocates climate capacity from laboratories to the federal chain of command.

Structure: Show adaptation as inherently local while mitigation remains national and global. | Trace the chain from national mission to municipal implementation. | Examine finance and staffing as the binding constraint on local action. | Add equity, since exposure and recovery differ sharply within one city. | Conclude on coordination achieved without recentralisation.

Dimensions: Adaptation is place-specific, since drainage, heat stress and crop damage differ across districts even inside a single state. | Fiscal devolution decides capacity, because assigned functions without predictable funds and trained staff produce plans instead of protection. | Scientific inputs need translation, as forecasts help only when converted into local protocols for hospitals, schools and workplaces. | Equity determines outcomes, since informal settlements and outdoor workers face the highest exposure and the slowest recovery.

Examples: State Action Plans on Climate Change created state frameworks whose implementation still depends on district and municipal capacity. | Ahmedabad's municipal heat plan assigned duties to hospitals, water suppliers and labour departments during declared alerts. | The Fifteenth Finance Commission provided distinct mitigation and response windows within disaster risk management funding. | Odisha's cyclone shelters and trained community volunteers turned central forecasts into completed evacuations.

Counterinterview: Localism has limits. Basins, coastlines and airsheds cross municipal and state boundaries, and small local bodies can neither finance protective infrastructure nor resist powerful land interests. Some resilience needs central standards, interstate coordination and financing that overrides local preference, so devolved execution requires binding national norms.

Conclusion: Resilience is federal engineering. It needs a mayor with money, a district officer with usable data, and a national framework that makes both obligations mandatory rather than merely exemplary.

Model framework for practice; it is not an official or unique UPSC answer.

7. Digital public infrastructure must expand agency, not merely transactions.

Working thesis: Counting payments, authentications and enrolments measures throughput rather than empowerment. Digital public infrastructure enlarges agency only when a person can obtain a service without an intermediary, understand what was done with her data, correct an error and carry her credentials elsewhere. The proposition demands a citizen-side test of success.

Structure: Define agency as choice, portability, comprehension and remedy. | Acknowledge the genuine scale achievement of India's digital rails. | Identify exclusion at the last mile. | Examine privacy and consent as conditions of agency rather than obstacles. | Address market concentration and the role of open standards.

Dimensions: Inclusion fails at the margin, where connectivity, worn fingerprints, missing documents and language exclude those most dependent on the service. | Privacy protects agency, since a person unable to know or contest data use cannot meaningfully consent to anything. | Open standards stop public rails from becoming private gatekeeping by keeping switching costs low and entry genuinely feasible. | Service delivery requires traceability, because a failed transaction without receipt, timeline and appeal is indistinguishable from denial.

Examples: UPI's interoperable design lets small merchants accept payments without being captured by a single payment application. | Puttaswamy (2017) requires legality, necessity and proportionality before the state intrudes upon informational privacy. | The Open Network for Digital Commerce attempts to unbundle discovery from platform control in online retail. | CoWIN issued vaccination certificates at national scale while relying on assisted registration for those without smartphones.

Counterinterview: Agency language can excuse inaction. Transaction efficiency itself delivers welfare: direct benefit transfers cut delay and diversion, and instant payments lowered the cost of credit and trade for small firms. Insisting on ideal empowerment before scaling would have denied millions the concrete gains already achieved.

Conclusion: Judge digital infrastructure by the citizen with the weakest connection and the thinnest paperwork. If she obtains the service, corrects her record and complains successfully, the system has expanded freedom rather than volume.

Model framework for practice; it is not an official or unique UPSC answer.

8. Agricultural prosperity requires moving from output security to income and ecological security.

Working thesis: The postcolonial food emergency justified maximising tonnage, and that mission succeeded. The binding problems now are farm income, price volatility, aquifer depletion and soil health, none of which improve automatically with higher yields. The proposition asks for a changed objective for agricultural policy, not a repudiation of its earlier achievement.

Structure: Credit the output-security era for ending dependence on imported grain. | Show why yield growth no longer resolves stagnant farm incomes. | Read subsidies, procurement and cropping incentives as ecological signals. | Examine risk management and diversification as income strategies. | Sequence reform so that transition does not impoverish the cultivator.

Dimensions: Marketing reform matters because realised income depends on price, storage and market access rather than on physical production alone. | Water pricing and free power push cultivation towards thirsty crops in regions whose aquifers cannot sustain that choice. | Risk instruments such as insurance, credit and price support decide whether a bad season becomes indebtedness or a manageable setback. | Diversification into millets, horticulture, livestock and agroforestry spreads income sources while reducing ecological pressure at the same time.

Examples: Green Revolution procurement in Punjab and Haryana secured national grain supply while entrenching paddy in a semi-arid belt. | Punjab's Preservation of Subsoil Water Act, 2009 delayed paddy transplanting to cut evaporation-driven groundwater extraction. | Operation Flood built farmer-owned dairy cooperatives that raised rural incomes through processing and marketing. | The International Year of Millets in 2023 promoted crops requiring far less irrigation than rice in dryland regions.

Counterinterview: Ecological reform can become a middle-class demand financed by farmers. Withdrawing power subsidies or assured procurement without a substitute income transfers risk to cultivators carrying thin margins and heavy debt. Sequencing is therefore decisive: assured markets, remunerative prices for alternative crops and credible income support must precede withdrawal.

Conclusion: Food security remains non-negotiable, yet it is now compatible with lower water use and higher farm incomes. Reform must change what agricultural policy rewards without gambling with the farmer's income or the nation's plate.
