

SOLVED PRACTICE WORKBOOK

Emerging Materials, Rare Earths and Critical Minerals - Learner-v2 Refreshed

UPSC complete learning session | Foundation to advanced | Concepts, evidence, practice and answer writing

Original deterministic study visual; labels are explanatory, not textual quotations.

Source order: repository knowledge -> official current linkage -> clearly marked analysis. No fabricated PYQs or statistics.

CONTENTS / WORKBOOK INDEX

Major learning parts and meaningful subtopics are listed in document order. Page numbers are generated from the final PDF layout; PDF bookmarks mirror the same hierarchy.

Emerging Materials, Rare Earths and Critical Minerals - Solved Practice Workbook 5

BASIC MCQS / REMEDIATION 5

Q1. Which statement correctly identifies Material-property structure?	5
Q2. Which option preserves the technical boundary of Material-property structure?	5
Q3. Which statement uses Material-property structure without changing its institution, unit or status?	6
Q4. Which option avoids the standard UPSC close-option trap about Material-property structure?	6
Q5. Which statement correctly identifies Advanced composite and smart materials?	6
Q6. Which option preserves the technical boundary of Advanced composite and smart materials?	7
Q7. Which statement uses Advanced composite and smart materials without changing its institution, unit or status?	7
Q8. Which option avoids the standard UPSC close-option trap about Advanced composite and smart materials?	8
Q9. Which statement correctly identifies Rare earth element definition?	8
Q10. Which option preserves the technical boundary of Rare earth element definition?	8
Q11. Which statement uses Rare earth element definition without changing its institution, unit or status?	9
Q12. Which option avoids the standard UPSC close-option trap about Rare earth element definition?	9
Q13. Which statement correctly identifies Light-heavy REE distinction?	10
Q14. Which option preserves the technical boundary of Light-heavy REE distinction?	10
Q15. Which statement uses Light-heavy REE distinction without changing its institution, unit or status?	10
Q16. Which option avoids the standard UPSC close-option trap about Light-heavy REE distinction?	11
Q17. Which statement correctly identifies Critical mineral versus rare earth?	11
Q18. Which option preserves the technical boundary of Critical mineral versus rare earth?	12
Q19. Which statement uses Critical mineral versus rare earth without changing its institution, unit or status?	12
Q20. Which option avoids the standard UPSC close-option trap about Critical mineral versus rare earth?	12
Q21. Which statement correctly identifies Permanent magnet chain?	13
Q22. Which option preserves the technical boundary of Permanent magnet chain?	13
Q23. Which statement uses Permanent magnet chain without changing its institution, unit or status?	14
Q24. Which option avoids the standard UPSC close-option trap about Permanent magnet chain?	14
Q25. Which statement correctly identifies Battery-mineral chemistry boundary?	14
Q26. Which option preserves the technical boundary of Battery-mineral chemistry boundary?	15
Q27. Which statement uses Battery-mineral chemistry boundary without changing its institution, unit or status?	15

Q28. Which option avoids the standard UPSC close-option trap about Battery-mineral chemistry boundary?	16
Q29. Which statement correctly identifies Other named uses?	16
Q30. Which option preserves the technical boundary of Other named uses?	16
Q31. Which statement uses Other named uses without changing its institution, unit or status?	17
Q32. Which option avoids the standard UPSC close-option trap about Other named uses?	17
Q33. Which statement correctly identifies Mining-to-component chain?	18
Q34. Which option preserves the technical boundary of Mining-to-component chain?	18
Q35. Which statement uses Mining-to-component chain without changing its institution, unit or status?	19
Q36. Which option avoids the standard UPSC close-option trap about Mining-to-component chain?	19
Q37. Which statement correctly identifies Resource reserve production refining firewall?	20
Q38. Which option preserves the technical boundary of Resource reserve production refining firewall?	20
Q39. Which statement uses Resource reserve production refining firewall without changing its institution, unit or status?	20
Q40. Which option avoids the standard UPSC close-option trap about Resource reserve production refining firewall?	21
Q41. Which statement correctly identifies Supply concentration and strategic dependency?	21
Q42. Which option preserves the technical boundary of Supply concentration and strategic dependency?	22
Q43. Which statement uses Supply concentration and strategic dependency without changing its institution, unit or status?	22
Q44. Which option avoids the standard UPSC close-option trap about Supply concentration and strategic dependency?	23
Q45. Which statement correctly identifies Diversification overseas access and stocks?	23
Q46. Which option preserves the technical boundary of Diversification overseas access and stocks?	23
Q47. Which statement uses Diversification overseas access and stocks without changing its institution, unit or status?	24
Q48. Which option avoids the standard UPSC close-option trap about Diversification overseas access and stocks?	24
Q49. Which statement correctly identifies Recycling urban mining and substitution?	25
Q50. Which option preserves the technical boundary of Recycling urban mining and substitution?	25
Q51. Which statement uses Recycling urban mining and substitution without changing its institution, unit or status?	26
Q52. Which option avoids the standard UPSC close-option trap about Recycling urban mining and substitution?	26
Q53. Which statement correctly identifies Environmental and social impact chain?	27
Q54. Which option preserves the technical boundary of Environmental and social impact chain?	27
Q55. Which statement uses Environmental and social impact chain without changing its institution, unit or status?	28
Q56. Which option avoids the standard UPSC close-option trap about Environmental and social impact chain?	28
Q57. Which statement correctly identifies Indian mission and policy boundaries?	29
Q58. Which option preserves the technical boundary of Indian mission and policy boundaries?	29
Q59. Which statement uses Indian mission and policy boundaries without changing its institution, unit or status?	29

Q60. Which option avoids the standard UPSC close-option trap about Indian mission and policy boundaries?	30
Q61. Which statement correctly identifies Indian institution map?	30
Q62. Which option preserves the technical boundary of Indian institution map?	31
Q63. Which statement uses Indian institution map without changing its institution, unit or status?	31
Q64. Which option avoids the standard UPSC close-option trap about Indian institution map?	32
Q65. Which statement correctly identifies MMDR exploration and auction distinction?	32
Q66. Which option preserves the technical boundary of MMDR exploration and auction distinction?	33
Q67. Which statement uses MMDR exploration and auction distinction without changing its institution, unit or status?	33
Q68. Which option avoids the standard UPSC close-option trap about MMDR exploration and auction distinction?	34
Q69. Which statement correctly identifies Deep-ocean and offshore boundary?	34
Q70. Which option preserves the technical boundary of Deep-ocean and offshore boundary?	34
Q71. Which statement uses Deep-ocean and offshore boundary without changing its institution, unit or status?	35
Q72. Which option avoids the standard UPSC close-option trap about Deep-ocean and offshore boundary?	35
Q73. Which statement correctly identifies Routed PYQ material tests?	36
Q74. Which option preserves the technical boundary of Routed PYQ material tests?	36
Q75. Which statement uses Routed PYQ material tests without changing its institution, unit or status?	37
Q76. Which option avoids the standard UPSC close-option trap about Routed PYQ material tests?	37
Q77. Which statement correctly identifies Volatile number and status firewall?	38
Q78. Which option preserves the technical boundary of Volatile number and status firewall?	38
Q79. Which statement uses Volatile number and status firewall without changing its institution, unit or status?	39
Q80. Which option avoids the standard UPSC close-option trap about Volatile number and status firewall?	39

Emerging Materials, Rare Earths and Critical Minerals - Solved Practice Workbook

BASIC MCQS / REMEDIATION

Q1. Which statement correctly identifies Material-property structure?

A. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. B. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. C. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. D. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response.

Answer: A. Explanation: A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q2. Which option preserves the technical boundary of Material-property structure?

A. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. B. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. C. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. D. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints.

Answer: B. Explanation: A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q3. Which statement uses Material-property structure without changing its institution, unit or status?

A. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. B. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. C. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. D. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich.

Answer: C. Explanation: A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q4. Which option avoids the standard UPSC close-option trap about Material-property structure?

A. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. B. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. C. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. D. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability.

Answer: D. Explanation: A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q5. Which statement correctly identifies Advanced composite and smart materials?

A. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. B. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. C. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. D. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may

be critical without being rare earth elements.

Answer: A. Explanation: An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q6. Which option preserves the technical boundary of Advanced composite and smart materials?

A. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. B. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. C. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. D. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities.

Answer: B. Explanation: An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q7. Which statement uses Advanced composite and smart materials without changing its institution, unit or status?

A. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. B. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. C. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. D. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role.

Answer: C. Explanation: An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q8. Which option avoids the standard UPSC close-option trap about Advanced composite and smart materials?

A. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. B. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. C. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. D. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response.

Answer: D. Explanation: An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q9. Which statement correctly identifies Rare earth element definition?

A. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. B. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. C. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. D. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities.

Answer: A. Explanation: Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q10. Which option preserves the technical boundary of Rare earth element definition?

A. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. B. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. C. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. D. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence,

while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities.

Answer: B. Explanation: Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q11. Which statement uses Rare earth element definition without changing its institution, unit or status?

A. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. B. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. C. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. D. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities.

Answer: C. Explanation: Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q12. Which option avoids the standard UPSC close-option trap about Rare earth element definition?

A. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. B. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. C. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. D. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints.

Answer: D. Explanation: Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q13. Which statement correctly identifies Light-heavy REE distinction?

A. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. B. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. C. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. D. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role.

Answer: A. Explanation: Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q14. Which option preserves the technical boundary of Light-heavy REE distinction?

A. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. B. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. C. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. D. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands.

Answer: B. Explanation: Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q15. Which statement uses Light-heavy REE distinction without changing its institution, unit or status?

A. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. B. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. C. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. D. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology

electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands.

Answer: C. Explanation: Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q16. Which option avoids the standard UPSC close-option trap about Light-heavy REE distinction?

A. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. B. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. C. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. D. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich.

Answer: D. Explanation: Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q17. Which statement correctly identifies Critical mineral versus rare earth?

A. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. B. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. C. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. D. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role.

Answer: A. Explanation: A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q18. Which option preserves the technical boundary of Critical mineral versus rare earth?

A. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. B. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. C. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. D. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands.

Answer: B. Explanation: A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q19. Which statement uses Critical mineral versus rare earth without changing its institution, unit or status?

A. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. B. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. C. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. D. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining.

Answer: C. Explanation: A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q20. Which option avoids the standard UPSC close-option trap about Critical mineral versus rare earth?

A. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. B. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. C. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic

forms, and neither stage should be collapsed into mining. D. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements.

Answer: D. Explanation: A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q21. Which statement correctly identifies Permanent magnet chain?

A. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. B. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. C. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. D. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands.

Answer: A. Explanation: Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q22. Which option preserves the technical boundary of Permanent magnet chain?

A. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. B. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. C. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. D. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner.

Answer: B. Explanation: Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q23. Which statement uses Permanent magnet chain without changing its institution, unit or status?

A. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. B. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. C. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. D. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner.

Answer: C. Explanation: Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q24. Which option avoids the standard UPSC close-option trap about Permanent magnet chain?

A. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. B. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. C. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. D. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities.

Answer: D. Explanation: Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q25. Which statement correctly identifies Battery-mineral chemistry boundary?

A. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. B. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. C. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. D. Owner-supported applications extend beyond batteries: gallium and germanium matter to

high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands.

Answer: A. Explanation: Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q26. Which option preserves the technical boundary of Battery-mineral chemistry boundary?

A. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. B. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. C. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. D. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore.

Answer: B. Explanation: Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q27. Which statement uses Battery-mineral chemistry boundary without changing its institution, unit or status?

A. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. B. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. C. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. D. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner.

Answer: C. Explanation: Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q28. Which option avoids the standard UPSC close-option trap about Battery-mineral chemistry boundary?

A. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. B. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. C. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. D. Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role.

Answer: D. Explanation: Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q29. Which statement correctly identifies Other named uses?

A. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. B. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. C. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. D. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining.

Answer: A. Explanation: Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q30. Which option preserves the technical boundary of Other named uses?

A. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. B. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. C. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter

in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. D. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply.

Answer: B. Explanation: Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q31. Which statement uses Other named uses without changing its institution, unit or status?

A. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. B. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. C. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. D. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply.

Answer: C. Explanation: Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q32. Which option avoids the standard UPSC close-option trap about Other named uses?

A. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. B. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. C. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. D. Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands.

Answer: D. Explanation: Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths

serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q33. Which statement correctly identifies Mining-to-component chain?

A. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. B. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. C. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. D. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner.

Answer: A. Explanation: Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q34. Which option preserves the technical boundary of Mining-to-component chain?

A. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. B. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. C. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. D. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply.

Answer: B. Explanation: Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q35. Which statement uses Mining-to-component chain without changing its institution, unit or status?

A. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. B. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. C. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. D. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply.

Answer: C. Explanation: Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q36. Which option avoids the standard UPSC close-option trap about Mining-to-component chain?

A. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. B. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. C. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. D. Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining.

Answer: D. Explanation: Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q37. Which statement correctly identifies Resource reserve production refining firewall?

A. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. B. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. C. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. D. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption.

Answer: A. Explanation: A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q38. Which option preserves the technical boundary of Resource reserve production refining firewall?

A. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. B. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. C. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. D. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption.

Answer: B. Explanation: A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q39. Which statement uses Resource reserve production refining firewall without changing its institution, unit or status?

A. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. B. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. C. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under

stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. D. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery.

Answer: C. Explanation: A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q40. Which option avoids the standard UPSC close-option trap about Resource reserve production refining firewall?

A. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. B. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. C. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. D. A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner.

Answer: D. Explanation: A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q41. Which statement correctly identifies Supply concentration and strategic dependency?

A. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. B. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. C. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. D. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption.

Answer: A. Explanation: Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than

at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q42. Which option preserves the technical boundary of Supply concentration and strategic dependency?

A. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. B. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. C. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. D. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy.

Answer: B. Explanation: Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q43. Which statement uses Supply concentration and strategic dependency without changing its institution, unit or status?

A. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. B. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. C. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. D. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy.

Answer: C. Explanation: Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q44. Which option avoids the standard UPSC close-option trap about Supply concentration and strategic dependency?

A. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. B. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. C. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. D. Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore.

Answer: D. Explanation: Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q45. Which statement correctly identifies Diversification overseas access and stocks?

A. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. B. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. C. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. D. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption.

Answer: A. Explanation: Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q46. Which option preserves the technical boundary of Diversification overseas access and stocks?

A. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. B. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. C. The Ministry of Mines

anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. D. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy.

Answer: B. Explanation: Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q47. Which statement uses Diversification overseas access and stocks without changing its institution, unit or status?

A. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. B. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. C. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. D. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries.

Answer: C. Explanation: Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q48. Which option avoids the standard UPSC close-option trap about Diversification overseas access and stocks?

A. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. B. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. C. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. D. Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply.

Answer: D. Explanation: Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q49. Which statement correctly identifies Recycling urban mining and substitution?

A. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. B. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. C. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. D. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries.

Answer: A. Explanation: Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q50. Which option preserves the technical boundary of Recycling urban mining and substitution?

A. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. B. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. C. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. D. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery.

Answer: B. Explanation: Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q51. Which statement uses Recycling urban mining and substitution without changing its institution, unit or status?

A. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. B. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. C. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. D. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged.

Answer: C. Explanation: Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q52. Which option avoids the standard UPSC close-option trap about Recycling urban mining and substitution?

A. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. B. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. C. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. D. Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption.

Answer: D. Explanation: Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q53. Which statement correctly identifies Environmental and social impact chain?

A. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. B. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. C. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. D. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged.

Answer: A. Explanation: Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q54. Which option preserves the technical boundary of Environmental and social impact chain?

A. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. B. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. C. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. D. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries.

Answer: B. Explanation: Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q55. Which statement uses Environmental and social impact chain without changing its institution, unit or status?

A. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. B. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. C. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. D. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged.

Answer: C. Explanation: Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q56. Which option avoids the standard UPSC close-option trap about Environmental and social impact chain?

A. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. B. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. C. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. D. Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy.

Answer: D. Explanation: Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q57. Which statement correctly identifies Indian mission and policy boundaries?

A. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. B. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. C. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. D. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries.

Answer: A. Explanation: The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q58. Which option preserves the technical boundary of Indian mission and policy boundaries?

A. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. B. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. C. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. D. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged.

Answer: B. Explanation: The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q59. Which statement uses Indian mission and policy boundaries without changing its institution, unit or status?

A. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. B. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. C. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh

Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. D. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production.

Answer: C. Explanation: The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q60. Which option avoids the standard UPSC close-option trap about Indian mission and policy boundaries?

A. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. B. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. C. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. D. The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery.

Answer: D. Explanation: The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q61. Which statement correctly identifies Indian institution map?

A. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. B. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. C. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. D. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production.

Answer: A. Explanation: The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes

monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q62. Which option preserves the technical boundary of Indian institution map?

A. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. B. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. C. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. D. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied.

Answer: B. Explanation: The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q63. Which statement uses Indian institution map without changing its institution, unit or status?

A. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. B. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. C. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. D. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner.

Answer: C. Explanation: The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q64. Which option avoids the standard UPSC close-option trap about Indian institution map?

A. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. B. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. C. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. D. The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries.

Answer: D. Explanation: The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q65. Which statement correctly identifies MMDR exploration and auction distinction?

A. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. B. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. C. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. D. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied.

Answer: A. Explanation: The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q66. Which option preserves the technical boundary of MMDR exploration and auction distinction?

A. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. B. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. C. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. D. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability.

Answer: B. Explanation: The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q67. Which statement uses MMDR exploration and auction distinction without changing its institution, unit or status?

A. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. B. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. C. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. D. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability.

Answer: C. Explanation: The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q68. Which option avoids the standard UPSC close-option trap about MMDR exploration and auction distinction?

A. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. B. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. C. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. D. The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged.

Answer: D. Explanation: The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q69. Which statement correctly identifies Deep-ocean and offshore boundary?

A. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. B. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. C. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. D. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability.

Answer: A. Explanation: MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q70. Which option preserves the technical boundary of Deep-ocean and offshore boundary?

A. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. B. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. C. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and

corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. D. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response.

Answer: B. Explanation: MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q71. Which statement uses Deep-ocean and offshore boundary without changing its institution, unit or status?

A. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. B. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. C. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. D. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response.

Answer: C. Explanation: MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q72. Which option avoids the standard UPSC close-option trap about Deep-ocean and offshore boundary?

A. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. B. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. C. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. D. MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production.

Answer: D. Explanation: MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an

allotted area is not commercial mining, proved reserves or production. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q73. Which statement correctly identifies Routed PYQ material tests?

A. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. B. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. C. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. D. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response.

Answer: A. Explanation: The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q74. Which option preserves the technical boundary of Routed PYQ material tests?

A. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. B. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. C. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. D. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability.

Answer: B. Explanation: The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q75. Which statement uses Routed PYQ material tests without changing its institution, unit or status?

A. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. B. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. C. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. D. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response.

Answer: C. Explanation: The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q76. Which option avoids the standard UPSC close-option trap about Routed PYQ material tests?

A. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. B. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. C. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. D. The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied.

Answer: D. Explanation: The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q77. Which statement correctly identifies Volatile number and status firewall?

A. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. B. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. C. A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. D. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response.

Answer: A. Explanation: Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q78. Which option preserves the technical boundary of Volatile number and status firewall?

A. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. B. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. C. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. D. An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response.

Answer: B. Explanation: Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q79. Which statement uses Volatile number and status firewall without changing its institution, unit or status?

A. Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. B. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. C. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. D. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich.

Answer: C. Explanation: Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

Q80. Which option avoids the standard UPSC close-option trap about Volatile number and status firewall?

A. Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. B. A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. C. Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. D. Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner.

Answer: D. Explanation: Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. The other options change the scientific category, institutional owner, measurement, mission rung or operating status.

PYQS AND ANSWER PRACTICE

AUDITED TOPIC-SPECIFIC PYQ OWNERSHIP

Audited ledgers route the 2022 monazite-rare-earth-thorium demand, the 2023 carbon-fibre demand, three 2025 demands on MSP/MMDR, EV-battery materials and REE uses, and the 2026 self-reliance mission demand to this owner. Three representative cards preserve all six routes without supplying an objective key, option or answer letter.

PYQ DEMAND CARD 1 - 2022 and 2025 Prelims GS-I

Demand: Assess the routed distinctions involving monazite, rare earths, thorium, government-policy boundaries, and the properties and uses of rare earth elements.

Status: Representative routed card covering 2022 Q28 and 2025 Q81; the 2022 official key is unavailable locally and the 2025 official Set-A key is not reproduced, so no option or answer letter is asserted.

Model solution: Rare earth element definition: Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. **Light-heavy REE distinction:** Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. **Permanent magnet chain:** Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. **Other named uses:** Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. **Indian institution map:** The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. **Volatile number and status firewall:** Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. The solution therefore answers the routed demand without inventing an official model answer or an objective answer key.

PYQ DEMAND CARD 2 - 2023 and 2025 Prelims GS-I

Demand: Assess carbon-fibre applications and recyclability, then classify lithium, cobalt, nickel and graphite by material and electrode role in EV batteries.

Status: Representative routed card covering 2023 Q53 and 2025 Q43; the 2023 key is unavailable locally and the 2025 official Set-A key is not reproduced, so no option or answer letter is asserted.

Model solution: Material-property structure: A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. **Advanced composite and smart materials:** An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. **Battery-mineral chemistry boundary:** Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. **Recycling urban mining and substitution:** Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse,

design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. **Routed PYQ material tests:** The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. The solution therefore answers the routed demand without inventing an official model answer or an objective answer key.

PYQ DEMAND CARD 3 - 2025 and 2026 Prelims GS-I

Demand: Assess Minerals Security Partnership, critical-mineral and MMDR boundaries, and India's rare-earth and critical-mineral self-reliance mission.

Status: Representative routed card covering 2025 Q6 and 2026 Q95; the 2025 official Set-A key is not reproduced and the 2026 key is provisional, so no option, answer or answer letter is asserted.

Model solution: Critical mineral versus rare earth: A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements.

Supply concentration and strategic dependency: Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. **Diversification overseas access and**

stocks: Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply. **Indian mission and policy boundaries:** The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. **MMDR exploration and auction distinction:** The owner records s.10BA Exploration Licence as a

competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. **Routed PYQ material tests:** The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. **Volatile number and status firewall:** Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. The solution therefore answers the routed demand without inventing an official model answer or an objective answer key.

ORIGINAL MAINS 1 - 10 MARKS

Question: Distinguish advanced, composite and smart materials through the structure-property-processing relationship. Answer in about 150 words.

Model thesis: Claim: Material-property structure. **Named evidence/example:** A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication.

Qualification: The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Advanced composite and smart materials. **Named evidence/example:** An advanced material is engineered for demanding functional performance; a composite

combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary.

Claim -> named evidence -> analysis -> qualification:

- A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability.
- An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response.

Qualified conclusion: Claim: Material-property structure. **Named evidence/example:** A material's observable performance follows from composition, atomic bonding, crystal or molecular structure, microstructure, defects and processing history; strength, stiffness, toughness, hardness, conductivity, magnetism and corrosion resistance are distinct properties, so one attractive property cannot certify whole-life suitability. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Advanced composite and smart materials. **Named evidence/example:** An advanced material is engineered for demanding functional performance; a composite combines a continuous matrix with a reinforcement so the constituents retain distinct roles, while a smart material changes a useful property in response to a stimulus. Carbon-fibre polymer composites offer high specific strength and stiffness, shape-memory alloys recover a programmed form after suitable stimulus, and piezoelectric materials couple mechanical stress with electrical response. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary.

ORIGINAL MAINS 2 - 10 MARKS

Question: Define rare earth elements and distinguish light and heavy REEs from the wider critical-minerals category. Answer in about 150 words.

Model thesis: Claim: Rare earth element definition. **Named evidence/example:** Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Light-heavy REE distinction. **Named evidence/example:** Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Critical mineral versus rare earth. **Named evidence/example:** A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary.

Claim -> named evidence -> analysis -> qualification:

- Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints.
- Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich.
- A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements.

Qualified conclusion: Claim: Rare earth element definition. **Named evidence/example:** Rare earth elements are the 15 lanthanides plus scandium and yttrium, a defined 17-element chemical group; the name does not mean every member is geologically rare, because economic concentration, separation difficulty and usable processing capability are the tighter constraints. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Light-heavy REE distinction. **Named evidence/example:** Light REEs include lanthanum, cerium, praseodymium and neodymium, whereas the owner highlights dysprosium, terbium and yttrium among heavy REEs; heavy-REE scarcity and separation concentration matter because high-temperature permanent magnets may require dysprosium or terbium, while India's monazite endowment is chiefly light-REE-rich. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Critical mineral versus rare earth. **Named evidence/example:** A critical mineral is a periodically reassessed policy category based on economic, technological or strategic importance plus supply vulnerability; REEs are one defined subgroup within that wider category, while lithium, cobalt, nickel and graphite may be critical without being rare earth elements. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary.

ORIGINAL MAINS 3 - 15 MARKS

Question: Explain permanent magnets and battery-mineral uses while preserving chemistry, electrode and component-manufacturing boundaries. Answer in about 250 words.

Model thesis: Claim: Permanent magnet chain. **Named evidence/example:** Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Battery-mineral chemistry boundary. **Named evidence/example:** Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Other named uses. **Named evidence/example:** Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system

category, legal character and development-to-deployment status boundary.

Claim -> named evidence -> analysis -> qualification:

- Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities.
- Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role.
- Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands.

Qualified conclusion: Claim: Permanent magnet chain. **Named evidence/example:** Rare-earth permanent magnets use elements such as neodymium in motors, electronics, aerospace and defence, while the owner identifies dysprosium or terbium as important to high-temperature performance; ore occurrence is not magnet security because separation, metal and alloy production, magnet manufacture, design and recycling remain separate capabilities.

Analysis: This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Battery-mineral chemistry boundary. **Named evidence/example:** Lithium is an active charge-carrier input across lithium-ion chemistries, nickel and cobalt occur in NMC or NCA cathodes, and graphite is commonly an anode material rather than a cathode constituent; LFP uses neither nickel nor cobalt and sodium-ion avoids lithium, so a mineral-use claim must identify chemistry and electrode role. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Other named uses. **Named evidence/example:** Owner-supported applications extend beyond batteries: gallium and germanium matter to high-technology electronics and semiconductors; copper supports electrical systems; rare earths serve magnets, phosphors, catalysts and specialised optics or electronics; titanium-bearing minerals are a separately named mineral-policy and geography input, while monazite links rare-earth values with thorium-bearing beach sands. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary.

ORIGINAL MAINS 4 - 15 MARKS

Question: Examine the mining-beneficiation-refining-processing chain and distinguish resources, reserves, production and refining capability. Answer in about 250 words.

Model thesis: Claim: Mining-to-component chain. **Named evidence/example:** Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Resource reserve production refining firewall. **Named evidence/example:** A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Supply concentration and strategic dependency. **Named evidence/example:** Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and

magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary.

Claim -> named evidence -> analysis -> qualification:

- Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining.
- A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner.
- Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore.

Qualified conclusion: Claim: Mining-to-component chain. **Named evidence/example:** Strategic capability runs through exploration, resource assessment, mine development, extraction, beneficiation, separation or refining, intermediate oxides-metals-alloys, component manufacture and end use; beneficiation upgrades ore, refining or separation produces usable chemical or metallic forms, and neither stage should be collapsed into mining. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Resource reserve production refining firewall. **Named evidence/example:** A resource is a geologically identified occurrence, a reserve is the economically and legally extractable subset under stated conditions, production is material actually extracted over a period, and refining or processing converts feed into usable specifications; none of these terms proves another, and country rankings or shares require a dated owner. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Supply concentration and strategic dependency. **Named evidence/example:** Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary.

ORIGINAL MAINS 5 - 20 MARKS

Question: Discuss a resilient critical-mineral strategy through diversification, overseas access, recycling, substitution and responsible mining. Answer in about 300 words.

Model thesis: Claim: Supply concentration and strategic dependency. **Named evidence/example:** Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Diversification overseas access and stocks. **Named evidence/example:** Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an

input to security, not proof of reserves, production or assured supply. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication.

Qualification: The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Recycling urban mining and substitution. **Named**

evidence/example: Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption. **Analysis:** This fixes the scientific process, system

boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Environmental and social impact chain. **Named evidence/example:** Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary.

Claim -> named evidence -> analysis -> qualification:

- Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore.
- Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply.
- Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity, economics and repeated-cycle quality require evidence rather than assumption.
- Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy.

Qualified conclusion: Claim: Supply concentration and strategic dependency. **Named evidence/example:**

Vulnerability can arise at extraction, refining, separation, intermediate-material or component stages, with rare-earth dependence often tighter in the midstream and magnet manufacture than at the mine; strategic dependency is therefore exposure to concentrated capability, trade disruption, technology, finance, logistics or offtake, not merely absence of domestic ore. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:**

Diversification overseas access and stocks. **Named evidence/example:** Resilience combines domestic exploration, responsible mining, diversified suppliers and refining locations, KABIL-type overseas engagement, trade or investment partnerships, material efficiency and strategic stocks where justified; an MoU, exploration licence, overseas block or asset acquisition is an input to security, not proof of reserves, production or assured supply.

Analysis: This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Recycling urban mining and substitution. **Named evidence/example:** Urban mining recovers materials from end-of-life batteries, electronics, magnets, catalytic converters and industrial scrap; repair, reuse, design for disassembly, collection, sorting, high-quality recovery, substitution and material efficiency complement recycling, while recovered quantity, purity,

economics and repeated-cycle quality require evidence rather than assumption. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Environmental and social impact chain. **Named evidence/example:** Mining can remove vegetation and topsoil, fragment habitat, generate dust and noise, disturb water balances and create overburden, tailings, drainage and closure liabilities; responsible siting, cumulative assessment, consultation, pollution control, water accounting, progressive reclamation, closure finance, community and FRA due diligence, disclosure and grievance redress must accompany mineral-security policy. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary.

ORIGINAL MAINS 6 - 20 MARKS

Question: Critically evaluate India's critical-mineral architecture through missions, institutions, law, deep-ocean exploration, routed PYQs and the volatile-status firewall. Answer in about 300 words.

Model thesis: **Claim:** Indian mission and policy boundaries. **Named evidence/example:** The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Indian institution map. **Named evidence/example:** The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** MMDR exploration and auction distinction. **Named evidence/example:** The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Deep-ocean and offshore boundary. **Named evidence/example:** MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Routed PYQ material tests. **Named evidence/example:** The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Volatile number and status firewall. **Named evidence/example:** Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. **Analysis:** This fixes the scientific process, system boundary,

institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary.

Claim -> named evidence -> analysis -> qualification:

- The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery.
- The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries.
- The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged.
- MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production.
- The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied.
- Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner.

Qualified conclusion: Claim: Indian mission and policy boundaries. **Named evidence/example:** The Ministry of Mines' expert critical-mineral assessment, the MMDR statutory Part D list and the Seventh Schedule exploration-licence list are different instruments; the National Critical Mineral Mission is a full-chain mission, but Cabinet approval, authorised outlay, scheme guideline, auction and incentive window do not establish expenditure, mine output, refining capacity or recovery. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary.

Claim: Indian institution map. **Named evidence/example:** The Ministry of Mines anchors policy; GSI surveys and explores; IBM handles mining-plan, scientific-mining and conservation functions; States grant concessions while the Centre auctions Part D minerals under the owner-recorded s.11D boundary; IREL under DAE processes monazite-related material; KABIL pursues overseas access; and MoEFCC or pollution-control institutions govern environmental and waste boundaries. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary.

Claim: MMDR exploration and auction distinction. **Named evidence/example:** The owner records s.10BA Exploration Licence as a competitively auctioned, State-granted right for reconnaissance and prospecting of Seventh Schedule minerals rather than a mining right, while s.11D places the auction of Part D concessions with the Centre although the State grants the concession and receives statutory proceeds; the three legal lists must not be merged. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Deep-ocean and offshore boundary. **Named evidence/example:** MoES and NIOT's Deep Ocean Mission addresses polymetallic-nodule exploration and technology in the Central Indian Ocean Basin under an International Seabed Authority contract, while offshore mineral

areas follow a legal regime separate from land mining; exploration, collector testing or an allotted area is not commercial mining, proved reserves or production. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Routed PYQ material tests. **Named evidence/example:** The routed objective demands require separate handling of monazite-rare-earth-thorium-policy links, carbon-fibre strength-lightness and difficult recycling, Minerals Security Partnership and MMDR reform, electrode-specific lithium-cobalt-nickel-graphite claims, rare-earth properties and uses, and the 2026 self-reliance mission route; no answer option or letter is supplied. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary. **Claim:** Volatile number and status firewall. **Named evidence/example:** Critical-mineral lists, statutory entries, reserves, resources, country rankings, production and refining shares, import dependence, auction counts, project milestones, investment, recycling capacity and recovery totals are date-sensitive; distinguish report, law, notification, approval, MoU, exploration, discovery, reserve declaration, construction, commissioning, production and verified outcome, and stop at the last dated owner. **Analysis:** This fixes the scientific process, system boundary, institution, application and verified capability rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, unit, institution, system category, legal character and development-to-deployment status boundary.
