

SOLVED PRACTICE WORKBOOK

Species and Current Affairs Tracker - Solved Practice Workbook

UPSC complete learning session | Foundation to advanced | Concepts, evidence, practice and answer writing

Original deterministic study visual; labels are explanatory, not textual quotations.

Source order: repository knowledge -> official current linkage -> clearly marked analysis. No fabricated PYQs or statistics.

CONTENTS / WORKBOOK INDEX

Major learning parts and meaningful subtopics are listed in document order. Page numbers are generated from the final PDF layout; PDF bookmarks mirror the same hierarchy.

Species and Current Affairs Tracker - Solved Practice Workbook 5

BASIC MCQS / REMEDIATION 5

Q1. Which statement correctly identifies Tracker-record boundary?	5
Q2. Which option preserves the ecological boundary of Tracker-record boundary?	5
Q3. Which statement uses Tracker-record boundary without changing its scale, parameter or status?	5
Q4. Which option avoids the standard UPSC close-option trap about Tracker-record boundary?	5
Q5. Which statement correctly identifies Taxonomic-identity boundary?	6
Q6. Which option preserves the ecological boundary of Taxonomic-identity boundary?	6
Q7. Which statement uses Taxonomic-identity boundary without changing its scale, parameter or status?	6
Q8. Which option avoids the standard UPSC close-option trap about Taxonomic-identity boundary?	6
Q9. Which statement correctly identifies Species-subspecies boundary?	7
Q10. Which option preserves the ecological boundary of Species-subspecies boundary?	7
Q11. Which statement uses Species-subspecies boundary without changing its scale, parameter or status?	7
Q12. Which option avoids the standard UPSC close-option trap about Species-subspecies boundary?	7
Q13. Which statement correctly identifies Common-name boundary?	8
Q14. Which option preserves the ecological boundary of Common-name boundary?	8
Q15. Which statement uses Common-name boundary without changing its scale, parameter or status?	8
Q16. Which option avoids the standard UPSC close-option trap about Common-name boundary?	8
Q17. Which statement correctly identifies IUCN-assessment boundary?	9
Q18. Which option preserves the ecological boundary of IUCN-assessment boundary?	9
Q19. Which statement uses IUCN-assessment boundary without changing its scale, parameter or status?	9
Q20. Which option avoids the standard UPSC close-option trap about IUCN-assessment boundary?	9
Q21. Which statement correctly identifies IUCN-date boundary?	10
Q22. Which option preserves the ecological boundary of IUCN-date boundary?	10
Q23. Which statement uses IUCN-date boundary without changing its scale, parameter or status?	10
Q24. Which option avoids the standard UPSC close-option trap about IUCN-date boundary?	10
Q25. Which statement correctly identifies WPA-legal boundary?	11
Q26. Which option preserves the ecological boundary of WPA-legal boundary?	11
Q27. Which statement uses WPA-legal boundary without changing its scale, parameter or status?	11

Q28. Which option avoids the standard UPSC close-option trap about WPA-legal boundary?	11
Q29. Which statement correctly identifies CITES-listing boundary?	12
Q30. Which option preserves the ecological boundary of CITES-listing boundary?	12
Q31. Which statement uses CITES-listing boundary without changing its scale, parameter or status?	12
Q32. Which option avoids the standard UPSC close-option trap about CITES-listing boundary?	12
Q33. Which statement correctly identifies CMS-listing boundary?	13
Q34. Which option preserves the ecological boundary of CMS-listing boundary?	13
Q35. Which statement uses CMS-listing boundary without changing its scale, parameter or status?	13
Q36. Which option avoids the standard UPSC close-option trap about CMS-listing boundary?	13
Q37. Which statement correctly identifies Endemic-native boundary?	14
Q38. Which option preserves the ecological boundary of Endemic-native boundary?	14
Q39. Which statement uses Endemic-native boundary without changing its scale, parameter or status?	14
Q40. Which option avoids the standard UPSC close-option trap about Endemic-native boundary?	14
Q41. Which statement correctly identifies Range-record boundary?	15
Q42. Which option preserves the ecological boundary of Range-record boundary?	15
Q43. Which statement uses Range-record boundary without changing its scale, parameter or status?	15
Q44. Which option avoids the standard UPSC close-option trap about Range-record boundary?	15
Q45. Which statement correctly identifies Habitat-range boundary?	16
Q46. Which option preserves the ecological boundary of Habitat-range boundary?	16
Q47. Which statement uses Habitat-range boundary without changing its scale, parameter or status?	16
Q48. Which option avoids the standard UPSC close-option trap about Habitat-range boundary?	17
Q49. Which statement correctly identifies Population-status boundary?	17
Q50. Which option preserves the ecological boundary of Population-status boundary?	17
Q51. Which statement uses Population-status boundary without changing its scale, parameter or status?	17
Q52. Which option avoids the standard UPSC close-option trap about Population-status boundary?	18
Q53. Which statement correctly identifies Trigger-static boundary?	18
Q54. Which option preserves the ecological boundary of Trigger-static boundary?	18
Q55. Which statement uses Trigger-static boundary without changing its scale, parameter or status?	18
Q56. Which option avoids the standard UPSC close-option trap about Trigger-static boundary?	19
Q57. Which statement correctly identifies News-notification boundary?	19
Q58. Which option preserves the ecological boundary of News-notification boundary?	19
Q59. Which statement uses News-notification boundary without changing its scale, parameter or status?	19

Q60. Which option avoids the standard UPSC close-option trap about News-notification boundary?	20
Q61. Which statement correctly identifies Status-verb boundary?	20
Q62. Which option preserves the ecological boundary of Status-verb boundary?	20
Q63. Which statement uses Status-verb boundary without changing its scale, parameter or status?	21
Q64. Which option avoids the standard UPSC close-option trap about Status-verb boundary?	21
Q65. Which statement correctly identifies Rediscovery boundary?	21
Q66. Which option preserves the ecological boundary of Rediscovery boundary?	21
Q67. Which statement uses Rediscovery boundary without changing its scale, parameter or status?	22
Q68. Which option avoids the standard UPSC close-option trap about Rediscovery boundary?	22
Q69. Which statement correctly identifies Cross-source reconciliation?	22
Q70. Which option preserves the ecological boundary of Cross-source reconciliation?	22
Q71. Which statement uses Cross-source reconciliation without changing its scale, parameter or status?	23
Q72. Which option avoids the standard UPSC close-option trap about Cross-source reconciliation?	23
Q73. Which statement correctly identifies Stale-current firewall?	23
Q74. Which option preserves the ecological boundary of Stale-current firewall?	23
Q75. Which statement uses Stale-current firewall without changing its scale, parameter or status?	24
Q76. Which option avoids the standard UPSC close-option trap about Stale-current firewall?	24
Q77. Which statement correctly identifies Current evidence boundary?	24
Q78. Which option preserves the ecological boundary of Current evidence boundary?	24
Q79. Which statement uses Current evidence boundary without changing its scale, parameter or status?	25
Q80. Which option avoids the standard UPSC close-option trap about Current evidence boundary?	25

Species and Current Affairs Tracker - Solved Practice Workbook

BASIC MCQS / REMEDIATION

Q1. Which statement correctly identifies Tracker-record boundary?

A. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. B. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. C. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. D. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry.

Answer: A. Explanation: A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q2. Which option preserves the ecological boundary of Tracker-record boundary?

A. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. B. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. C. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. D. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another.

Answer: B. Explanation: A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q3. Which statement uses Tracker-record boundary without changing its scale, parameter or status?

A. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. B. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. C. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. D. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry.

Answer: C. Explanation: A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q4. Which option avoids the standard UPSC close-option trap about Tracker-record boundary?

A. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. B. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. C. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. D. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record.

Answer: D. Explanation: A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q5. Which statement correctly identifies Taxonomic-identity boundary?

A. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. B. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. C. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. D. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry.

Answer: A. Explanation: Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q6. Which option preserves the ecological boundary of Taxonomic-identity boundary?

A. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. B. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. C. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. D. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry.

Answer: B. Explanation: Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q7. Which statement uses Taxonomic-identity boundary without changing its scale, parameter or status?

A. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. B. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. C. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. D. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing.

Answer: C. Explanation: Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q8. Which option avoids the standard UPSC close-option trap about Taxonomic-identity boundary?

A. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. B. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. C. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. D. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region.

Answer: D. Explanation: Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q9. Which statement correctly identifies Species-subspecies boundary?

A. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. B. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. C. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. D. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry.

Answer: A. Explanation: Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q10. Which option preserves the ecological boundary of Species-subspecies boundary?

A. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. B. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. C. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. D. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category.

Answer: B. Explanation: Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q11. Which statement uses Species-subspecies boundary without changing its scale, parameter or status?

A. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. B. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. C. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. D. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse.

Answer: C. Explanation: Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q12. Which option avoids the standard UPSC close-option trap about Species-subspecies boundary?

A. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. B. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. C. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. D. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another.

Answer: D. Explanation: Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q13. Which statement correctly identifies Common-name boundary?

A. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. B. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. C. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. D. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing.

Answer: A. Explanation: A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q14. Which option preserves the ecological boundary of Common-name boundary?

A. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. B. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. C. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. D. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule.

Answer: B. Explanation: A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q15. Which statement uses Common-name boundary without changing its scale, parameter or status?

A. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. B. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. C. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. D. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly.

Answer: C. Explanation: A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q16. Which option avoids the standard UPSC close-option trap about Common-name boundary?

A. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. B. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. C. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. D. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry.

Answer: D. Explanation: A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q17. Which statement correctly identifies IUCN-assessment boundary?

A. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. B. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. C. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. D. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category.

Answer: A. Explanation: An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q18. Which option preserves the ecological boundary of IUCN-assessment boundary?

A. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. B. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. C. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. D. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category.

Answer: B. Explanation: An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q19. Which statement uses IUCN-assessment boundary without changing its scale, parameter or status?

A. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. B. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. C. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. D. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting.

Answer: C. Explanation: An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q20. Which option avoids the standard UPSC close-option trap about IUCN-assessment boundary?

A. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. B. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. C. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. D. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing.

Answer: D. Explanation: An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q21. Which statement correctly identifies IUCN-date boundary?

A. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. B. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. C. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. D. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly.

Answer: A. Explanation: A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q22. Which option preserves the ecological boundary of IUCN-date boundary?

A. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. B. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. C. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. D. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule.

Answer: B. Explanation: A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q23. Which statement uses IUCN-date boundary without changing its scale, parameter or status?

A. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. B. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. C. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. D. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly.

Answer: C. Explanation: A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q24. Which option avoids the standard UPSC close-option trap about IUCN-date boundary?

A. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. B. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. C. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. D. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse.

Answer: D. Explanation: A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q25. Which statement correctly identifies WPA-legal boundary?

A. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. B. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. C. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. D. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting.

Answer: A. Explanation: A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q26. Which option preserves the ecological boundary of WPA-legal boundary?

A. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. B. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. C. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. D. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting.

Answer: B. Explanation: A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q27. Which statement uses WPA-legal boundary without changing its scale, parameter or status?

A. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. B. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. C. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. D. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range.

Answer: C. Explanation: A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q28. Which option avoids the standard UPSC close-option trap about WPA-legal boundary?

A. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. B. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. C. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. D. A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category.

Answer: D. Explanation: A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q29. Which statement correctly identifies CITES-listing boundary?

A. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. B. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. C. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. D. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range.

Answer: A. Explanation: A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q30. Which option preserves the ecological boundary of CITES-listing boundary?

A. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. B. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. C. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. D. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range.

Answer: B. Explanation: A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q31. Which statement uses CITES-listing boundary without changing its scale, parameter or status?

A. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. B. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. C. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. D. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range.

Answer: C. Explanation: A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q32. Which option avoids the standard UPSC close-option trap about CITES-listing boundary?

A. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. B. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. C. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. D. A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule.

Answer: D. Explanation: A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q33. Which statement correctly identifies CMS-listing boundary?

A. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. B. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. C. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. D. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range.

Answer: A. Explanation: A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q34. Which option preserves the ecological boundary of CMS-listing boundary?

A. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. B. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. C. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. D. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another.

Answer: B. Explanation: A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q35. Which statement uses CMS-listing boundary without changing its scale, parameter or status?

A. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. B. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. C. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. D. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates.

Answer: C. Explanation: A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q36. Which option avoids the standard UPSC close-option trap about CMS-listing boundary?

A. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. B. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. C. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. D. A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly.

Answer: D. Explanation: A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q37. Which statement correctly identifies Endemic-native boundary?

A. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. B. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. C. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. D. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs.

Answer: A. Explanation: Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q38. Which option preserves the ecological boundary of Endemic-native boundary?

A. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. B. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. C. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. D. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs.

Answer: B. Explanation: Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q39. Which statement uses Endemic-native boundary without changing its scale, parameter or status?

A. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. B. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. C. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. D. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another.

Answer: C. Explanation: Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q40. Which option avoids the standard UPSC close-option trap about Endemic-native boundary?

A. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. B. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. C. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. D. Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting.

Answer: D. Explanation: Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting.

sighting. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q41. Which statement correctly identifies Range-record boundary?

A. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. B. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. C. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. D. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another.

Answer: A. Explanation: A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q42. Which option preserves the ecological boundary of Range-record boundary?

A. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. B. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. C. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. D. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another.

Answer: B. Explanation: A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q43. Which statement uses Range-record boundary without changing its scale, parameter or status?

A. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. B. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. C. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. D. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry.

Answer: C. Explanation: A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q44. Which option avoids the standard UPSC close-option trap about Range-record boundary?

A. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. B. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. C. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. D. A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range.

Answer: D. Explanation: A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q45. Which statement correctly identifies Habitat-range boundary?

A. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. B. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. C. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. D. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another.

Answer: A. Explanation: Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q46. Which option preserves the ecological boundary of Habitat-range boundary?

A. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. B. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. C. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. D. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb.

Answer: B. Explanation: Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q47. Which statement uses Habitat-range boundary without changing its scale, parameter or status?

A. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. B. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. C. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. D. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb.

Answer: C. Explanation: Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q48. Which option avoids the standard UPSC close-option trap about Habitat-range boundary?

A. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. B. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. C. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. D. Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs.

Answer: D. Explanation: Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q49. Which statement correctly identifies Population-status boundary?

A. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. B. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. C. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. D. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates.

Answer: A. Explanation: Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q50. Which option preserves the ecological boundary of Population-status boundary?

A. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. B. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. C. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. D. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend.

Answer: B. Explanation: Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q51. Which statement uses Population-status boundary without changing its scale, parameter or status?

A. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. B. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. C. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. D. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb.

Answer: C. Explanation: Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q52. Which option avoids the standard UPSC close-option trap about Population-status boundary?

A. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. B. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. C. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. D. Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another.

Answer: D. Explanation: Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q53. Which statement correctly identifies Trigger-static boundary?

A. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. B. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. C. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. D. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend.

Answer: A. Explanation: A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q54. Which option preserves the ecological boundary of Trigger-static boundary?

A. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. B. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. C. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. D. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status.

Answer: B. Explanation: A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q55. Which statement uses Trigger-static boundary without changing its scale, parameter or status?

A. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. B. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. C. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. D. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend.

Answer: C. Explanation: A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it

illustrates. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q56. Which option avoids the standard UPSC close-option trap about Trigger-static boundary?

A. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. B. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. C. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. D. A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates.

Answer: D. Explanation: A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q57. Which statement correctly identifies News-notification boundary?

A. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. B. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. C. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. D. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb.

Answer: A. Explanation: A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q58. Which option preserves the ecological boundary of News-notification boundary?

A. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. B. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. C. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. D. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend.

Answer: B. Explanation: A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q59. Which statement uses News-notification boundary without changing its scale, parameter or status?

A. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. B. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. C. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. D. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly.

Answer: C. Explanation: A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q60. Which option avoids the standard UPSC close-option trap about News-notification boundary?

A. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. B. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. C. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. D. A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry.

Answer: D. Explanation: A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q61. Which statement correctly identifies Status-verb boundary?

A. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. B. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. C. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. D. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend.

Answer: A. Explanation: Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q62. Which option preserves the ecological boundary of Status-verb boundary?

A. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. B. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. C. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. D. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly.

Answer: B. Explanation: Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q63. Which statement uses Status-verb boundary without changing its scale, parameter or status?

A. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. B. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. C. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. D. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly.

Answer: C. Explanation: Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q64. Which option avoids the standard UPSC close-option trap about Status-verb boundary?

A. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. B. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. C. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. D. Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb.

Answer: D. Explanation: Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q65. Which statement correctly identifies Rediscovery boundary?

A. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. B. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. C. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. D. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes.

Answer: A. Explanation: A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q66. Which option preserves the ecological boundary of Rediscovery boundary?

A. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. B. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. C. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. D. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record.

Answer: B. Explanation: A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q67. Which statement uses Rediscovery boundary without changing its scale, parameter or status?

A. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. B. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. C. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. D. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region.

Answer: C. Explanation: A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q68. Which option avoids the standard UPSC close-option trap about Rediscovery boundary?

A. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. B. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. C. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. D. A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend.

Answer: D. Explanation: A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q69. Which statement correctly identifies Cross-source reconciliation?

A. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. B. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. C. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. D. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes.

Answer: A. Explanation: IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q70. Which option preserves the ecological boundary of Cross-source reconciliation?

A. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. B. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. C. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. D. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region.

Answer: B. Explanation: IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q71. Which statement uses Cross-source reconciliation without changing its scale, parameter or status?

A. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. B. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. C. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. D. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record.

Answer: C. Explanation: IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q72. Which option avoids the standard UPSC close-option trap about Cross-source reconciliation?

A. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. B. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. C. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. D. IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status.

Answer: D. Explanation: IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q73. Which statement correctly identifies Stale-current firewall?

A. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. B. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. C. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. D. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record.

Answer: A. Explanation: Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q74. Which option preserves the ecological boundary of Stale-current firewall?

A. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. B. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. C. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. D. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another.

Answer: B. Explanation: Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q75. Which statement uses Stale-current firewall without changing its scale, parameter or status?

A. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. B. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. C. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. D. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another.

Answer: C. Explanation: Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q76. Which option avoids the standard UPSC close-option trap about Stale-current firewall?

A. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. B. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. C. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. D. Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes.

Answer: D. Explanation: Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q77. Which statement correctly identifies Current evidence boundary?

A. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. B. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. C. A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. D. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region.

Answer: A. Explanation: Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q78. Which option preserves the ecological boundary of Current evidence boundary?

A. Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. B. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. C. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. D. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another.

Answer: B. Explanation: Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q79. Which statement uses Current evidence boundary without changing its scale, parameter or status?

A. Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. B. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. C. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. D. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing.

Answer: C. Explanation: Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

Q80. Which option avoids the standard UPSC close-option trap about Current evidence boundary?

A. A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. B. An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. C. A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. D. Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly.

Answer: D. Explanation: Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. The other options belong to different media, parameters, processes, scales, actors, institutions, instruments or status categories.

PYQS AND ANSWER PRACTICE

AUDITED SPECIES IDENTITY, ECOLOGY, RANGE, STATUS AND CURRENT-AFFAIRS PYQ OWNERSHIP

Audited ledgers route species identity, behaviour, range and institution questions, including provisionally keyed 2026 and answer-free objective demands. No option, species status, range, population or listing is inferred.

OWNER PYQ LEDGER EXTRACTS

9. PYQ application

- ANALYSIS: Recurring Prelims pattern: questions increasingly combine a static concept with a requirement to identify or apply the latest verified current-affairs instance of that concept (e.g., "which of the following is India's most recently added Ramsar site").
- ANALYSIS: Mains linkage: dated current anchors (COP29/30 outcomes, Ramsar milestone, Tiger Reserve expansion) provide the "CURRENT: current anchor" evidence expected in a well-rounded GS-III answer.

2026 PYQ Integration

Status: 2026 question-level PYQ demand is integrated into this owner. **Provenance:** Audited local official-paper routing ledgers: _PYQ-ROUTING-PRELIMS-2026.md. **Answer-key rule:** The 2026 Prelims and CSAT Set-A keys held locally are **provisional**; no option or answer is recorded or inferred in this integration.

- **Year represented:** 2026
- **Paper(s):** Prelims GS-I
- **Routed question demands:** 1

Year	Paper	Q	PYQ demand (neutral rendering)	Directive / format	Source status	Owner requirement
2026	Prelims GS-I	36	Foxtail orchid distribution, epiphytic habit, and State-flower status	Objective question; provisional 2026 Set-A key present locally, answer not inferred	Provisional 2026 Set-A key present locally (Ans - 2026 - GS1 - Provisional); key is provisional - no answer letter recorded or inferred here	Cover the named fact/concept and its likely statement-level distinctions.

What this owner must now support

- Foxtail orchid distribution, epiphytic habit, and State-flower status

This block integrates the 2026 examinable demand and paper metadata. It is kept separate from the 2018-2023 and 2024-2025 blocks and does not convert a provisionally-keyed, answer-free objective question into a solved answer.

Recent PYQ Integration (2024-2025)

Status: 2024-2025 question-level PYQ demand is integrated into this owner. **Provenance:** Audited local official-paper routing ledgers: _PYQ-ROUTING-PRELIMS-2024-2025.md. **Answer-key rule:** The official 2024-2025 Prelims Set-A keys are present in the repository and CSAT Set-A keys are supplied; even so, no option or answer is recorded or inferred in this integration.

- **Years represented:** 2024, 2025
- **Paper(s):** Prelims GS-I
- **Routed question demands:** 2

Year	Paper	Q	PYQ demand (neutral rendering)	Directive / format	Source status	Owner requirement
2024	Prelims GS-I	25	Behaviour of big cats (lions, cheetahs, leopards)	Objective question; official Set-A key available locally, answer not inferred	Key available locally (official Set-A answer key present); answer not recorded here	Cover the named fact/concept and its likely statement-level distinctions.
2025	Prelims GS-I	37	Peacock (Gooty) tarantula - endemic species	Objective question; official Set-A key available locally, answer not inferred	Key available locally (official Set-A answer key present); answer not recorded here	Cover the named fact/concept and its likely statement-level distinctions.

What this owner must now support

- Behaviour of big cats (lions, cheetahs, leopards)
- Peacock (Gooty) tarantula - endemic species

This block integrates the 2024-2025 examinable demand and paper metadata. It is kept separate from the 2018-2023 block and does not convert an unkeyed/answer-free objective question into a solved answer.

Historical PYQ Integration (2018-2023)

Status: Question-level PYQ demand is integrated into this owner. **Provenance:** Audited local official-paper routing ledgers: _PYQ-ROUTING-PRELIMS-2018-2023.md. **Answer-key rule:** The official 2018-2023 Prelims/CSAT keys are not held locally; no option or answer has been inferred.

- **Years represented:** 2018, 2019, 2020, 2021, 2022, 2023
- **Paper(s):** Prelims GS-I
- **Routed question demands:** 13

Year	Paper	Q	PYQ demand (neutral rendering)	Directive / format	Source status	Owner requirement
2018	Prelims GS-I	86	Prosopis juliflora invasive plant ecological biodiversity impact	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2019	Prelims GS-I	31	Himalayan nettle Girardinia diversifolia sustainable uses	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2020	Prelims GS-I	72	Indian elephants ecology gestation calving and state distribution	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2020	Prelims GS-I	74	Indian bird species frogmouth barbet minivet redstart identification	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2020	Prelims GS-I	77	Musk deer natural habitat in Himalayan protected areas	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2021	Prelims GS-I	21	Plants used as natural mosquito repellents	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2021	Prelims GS-I	23	Animals rolling up to protect vulnerable body parts	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2021	Prelims GS-I	63	Moringa drumstick tamarind tree properties and uses	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2022	Prelims GS-I	45	Himalayan forest fungus species characteristics and cultivation	Objective question; official key unavailable locally	Stem verified against official scan; OCR artifact resolved; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2023	Prelims GS-I	14	Nocturnal behaviour among Indian fauna species	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2023	Prelims GS-I	15	Waggle dance communication in honeybee colonies	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2023	Prelims GS-I	17	Indian squirrel nesting food-storage and dietary behaviour	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2023	Prelims GS-I	19	Orangutan tool-making behaviour stick scraping insects	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.

What this owner must now support

- Prosopis juliflora invasive plant ecological biodiversity impact
- Himalayan nettle Girardinia diversifolia sustainable uses

- Indian elephants ecology gestation calving and state distribution
- Indian bird species frogmouth barbet minivet redstart identification
- Musk deer natural habitat in Himalayan protected areas
- Plants used as natural mosquito repellents
- Animals rolling up to protect vulnerable body parts
- Moringa drumstick tamarind tree properties and uses
- Himalayan forest fungus species characteristics and cultivation
- Nocturnal behaviour among Indian fauna species
- Waggle dance communication in honeybee colonies
- Indian squirrel nesting food-storage and dietary behaviour
- Orangutan tool-making behaviour stick scraping insects

The table integrates the examinable demand and paper metadata. It does not turn an unkeyed objective question into a solved answer, and it does not claim that lexical presence alone proves full conceptual sufficiency.

10. PYQ-based analytical application

- ANALYSIS: Prelims questions increasingly test the *most recent* verified instance of a recurring category (latest Ramsar site, latest Tiger Reserve, latest COP outcome) - maintaining a disciplined, dated tracker is the most reliable preparation method for this question type.
- ANALYSIS: Mains answers should demonstrate the cross-topic synthesis technique (Section 2), explicitly connecting a current-affairs anchor to at least one relevant static-concept file for full analytical credit.

ORIGINAL MAINS 1 - 10 MARKS

Question: Design a reliable species current-affairs tracker entry. Answer in about 150 words.

Model thesis: **Claim:** Tracker-record boundary. **Named evidence/example:** A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Taxonomic-identity boundary. **Named evidence/example:** Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Common-name boundary. **Named evidence/example:** A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Trigger-static boundary. **Named evidence/example:** A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Status-verb boundary. **Named evidence/example:** Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather

than generalise beyond the owner. **Claim:** Stale-current firewall. **Named evidence/example:** Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Claim -> named evidence -> analysis -> qualification:

- A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record.
- Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region.
- A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry.
- A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates.
- Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb.
- Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes.

Qualified conclusion: Claim: Tracker-record boundary. **Named evidence/example:** A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Taxonomic-identity boundary. **Named evidence/example:** Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Common-name boundary. **Named evidence/example:** A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Trigger-static boundary. **Named evidence/example:** A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Status-verb boundary. **Named evidence/example:** Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Stale-current firewall. **Named evidence/example:** Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Demand decoding: The directive **answer** requires a direct position on “Design a reliable species current-affairs tracker entry. Answer in about 150 words.”, every clause, exact ecological mechanism and scale, named Indian law or institution, dated treaty/policy status, evidence, trade-offs and a qualified conclusion.

Detailed examiner-grade model answer:

Introduction and thesis: **Claim:** Tracker-record boundary. **Named evidence/example:** A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Taxonomic-identity boundary. **Named evidence/example:** Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Common-name boundary. **Named evidence/example:** A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Trigger-static boundary. **Named evidence/example:** A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Status-verb boundary. **Named evidence/example:** Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Stale-current firewall. **Named evidence/example:** Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Analytical body:

1. **Claim and named evidence:** A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
2. **Claim and named evidence:** Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
3. **Claim and named evidence:** A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.

4. **Claim and named evidence:** A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
5. **Claim and named evidence:** Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
6. **Claim and named evidence:** Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.

Counter-position / limit: A designation, schedule, COP decision, policy target, budget, installed capacity, registration, treatment capacity or chronological association cannot alone establish ecological recovery, compliance, attribution or net climate benefit; test mechanism, monitoring, counterfactual and implementation.

Qualified conclusion: Claim: Tracker-record boundary. **Named evidence/example:** A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Taxonomic-identity boundary. **Named evidence/example:** Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Common-name boundary. **Named evidence/example:** A vernacular or media name is a discovery aid, not sufficient identity evidence; the verified scientific name should anchor the tracker entry. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Trigger-static boundary. **Named evidence/example:** A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Status-verb boundary. **Named evidence/example:** Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Stale-current firewall. **Named evidence/example:** Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Executable exam-length answer / compression plan: For 10 marks, spend one-sixth of the time decoding the directive and drawing definition -> mechanism/status -> institution/instrument -> implementation -> ecological and social outcome; write four to seven claim -> named evidence -> analysis -> qualification points; reserve the final minute for taxon, unit, baseline, date, jurisdiction, exception, causation and residual-risk checks.

Why this earns marks: The answer obeys the directive, explains mechanisms rather than listing schemes, uses India-centric evidence and preserves ecological, species, legal, treaty, institutional, climate-unit, pollution-standard and causal distinctions.

How to improve this answer: For “Design a reliable species current-affairs tracker entry. Answer in about 150 words.”, replace the weakest catalogue point with one exact mechanism or distinction, named law/institution/treaty/species, dated status, measurable outcome, implementation constraint and answer-specific qualification.

ORIGINAL MAINS 2 - 10 MARKS

Question: Distinguish IUCN, WPA, CITES and CMS status claims. Answer in about 150 words.

Model thesis: **Claim:** IUCN-assessment boundary. **Named evidence/example:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** IUCN-date boundary. **Named evidence/example:** A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** WPA-legal boundary. **Named evidence/example:** A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CITES-listing boundary. **Named evidence/example:** A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CMS-listing boundary. **Named evidence/example:** A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Claim -> named evidence -> analysis -> qualification:

- An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing.
- A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse.
- A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category.
- A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule.

- A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly.

Qualified conclusion: **Claim:** IUCN-assessment boundary. **Named evidence/example:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** IUCN-date boundary. **Named evidence/example:** A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** WPA-legal boundary. **Named evidence/example:** A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CITES-listing boundary. **Named evidence/example:** A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CMS-listing boundary. **Named evidence/example:** A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Demand decoding: The directive **answer** requires a direct position on "Distinguish IUCN, WPA, CITES and CMS status claims. Answer in about 150 words.", every clause, exact ecological mechanism and scale, named Indian law or institution, dated treaty/policy status, evidence, trade-offs and a qualified conclusion.

Detailed examiner-grade model answer:

Introduction and thesis: **Claim:** IUCN-assessment boundary. **Named evidence/example:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** IUCN-date boundary. **Named evidence/example:** A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** WPA-legal boundary. **Named evidence/example:** A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CITES-listing boundary. **Named evidence/example:** A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the

claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CMS-listing boundary. **Named evidence/example:** A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Analytical body:

1. **Claim and named evidence:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
2. **Claim and named evidence:** A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
3. **Claim and named evidence:** A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
4. **Claim and named evidence:** A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
5. **Claim and named evidence:** A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.

Counter-position / limit: A designation, schedule, COP decision, policy target, budget, installed capacity, registration, treatment capacity or chronological association cannot alone establish ecological recovery, compliance, attribution or net climate benefit; test mechanism, monitoring, counterfactual and implementation.

Qualified conclusion: **Claim:** IUCN-assessment boundary. **Named evidence/example:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** IUCN-date boundary. **Named evidence/example:** A Red List category can become stale when reassessed; every status claim should carry the cited assessment or publication date and be rechecked before reuse. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** WPA-legal boundary. **Named evidence/example:** A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The

conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CITES-listing boundary. **Named evidence/example:** A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CMS-listing boundary. **Named evidence/example:** A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Executable exam-length answer / compression plan: For 10 marks, spend one-sixth of the time decoding the directive and drawing definition -> mechanism/status -> institution/instrument -> implementation -> ecological and social outcome; write four to seven claim -> named evidence -> analysis -> qualification points; reserve the final minute for taxon, unit, baseline, date, jurisdiction, exception, causation and residual-risk checks.

Why this earns marks: The answer obeys the directive, explains mechanisms rather than listing schemes, uses India-centric evidence and preserves ecological, species, legal, treaty, institutional, climate-unit, pollution-standard and causal distinctions.

How to improve this answer: For "Distinguish IUCN, WPA, CITES and CMS status claims. ORIGINAL MAINS 3 - 15 MARKS

Question: Explain endemic, native, range, habitat and occurrence distinctions. Answer in about 250 words.

Model thesis: **Claim:** Endemic-native boundary. **Named evidence/example:** Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Range-record boundary. **Named evidence/example:** A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Habitat-range boundary. **Named evidence/example:** Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Claim -> named evidence -> analysis -> qualification:

- Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting.
- A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range.
- Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs.

Qualified conclusion: Claim: Endemic-native boundary. **Named evidence/example:** Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Range-record boundary. **Named evidence/example:** A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Habitat-range boundary. **Named evidence/example:** Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Demand decoding: The directive **explain** requires a direct position on “Explain endemic, native, range, habitat and occurrence distinctions. Answer in about 250...”, every clause, exact ecological mechanism and scale, named Indian law or institution, dated treaty/policy status, evidence, trade-offs and a qualified conclusion.

Detailed examiner-grade model answer:

Introduction and thesis: Claim: Endemic-native boundary. **Named evidence/example:** Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Range-record boundary. **Named evidence/example:** A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Habitat-range boundary. **Named evidence/example:** Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Analytical body:

1. **Claim and named evidence:** Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
2. **Claim and named evidence:** A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.

3. **Claim and named evidence:** Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.

Counter-position / limit: A designation, schedule, COP decision, policy target, budget, installed capacity, registration, treatment capacity or chronological association cannot alone establish ecological recovery, compliance, attribution or net climate benefit; test mechanism, monitoring, counterfactual and implementation.

Qualified conclusion: Claim: Endemic-native boundary. **Named evidence/example:** Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Range-record boundary. **Named evidence/example:** A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Habitat-range boundary. **Named evidence/example:** Habitat association describes ecological use, while geographic range describes distribution; an organism using a habitat type is not necessarily present everywhere that habitat occurs. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Executable exam-length answer / compression plan: For 15 marks, spend one-sixth of the time decoding the directive and drawing definition -> mechanism/status -> institution/instrument -> implementation -> ecological and social outcome; write four to seven claim -> named evidence -> analysis -> qualification points; reserve the final minute for taxon, unit, baseline, date, jurisdiction, exception, causation and residual-risk checks.

Why this earns marks: The answer obeys the directive, explains mechanisms rather than listing schemes, uses India-centric evidence and preserves ecological, species, legal, treaty, institutional, climate-unit, pollution-standard and causal distinctions.

How to improve this answer: For "Explain endemic, native, range, habitat and occurrence distinctions. Answer in about 250...", replace the weakest catalogue point with one exact mechanism or distinction, named law/institution/treaty/species, dated status, measurable outcome, implementation constraint and answer-specific qualification.

ORIGINAL MAINS 4 - 15 MARKS

Question: Explain why population, trend and risk category require separate evidence. Answer in about 250 words.

Model thesis: Claim: Species-subspecies boundary. **Named evidence/example:** Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** IUCN-assessment boundary. **Named evidence/example:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Population-status boundary. **Named evidence/example:** Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot

be inferred from another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Current evidence boundary. **Named evidence/example:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Claim -> named evidence -> analysis -> qualification:

- Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another.
- An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing.
- Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another.
- Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly.

Qualified conclusion: Claim: Species-subspecies boundary. **Named evidence/example:** Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** IUCN-assessment boundary. **Named evidence/example:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Population-status boundary. **Named evidence/example:** Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Current evidence boundary. **Named evidence/example:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Demand decoding: The directive **explain** requires a direct position on "Explain why population, trend and risk category require separate evidence. Answer in about...", every clause, exact ecological mechanism and scale, named Indian law or institution, dated treaty/policy status, evidence, trade-offs and a qualified conclusion.

Detailed examiner-grade model answer:

Introduction and thesis: Claim: Species-subspecies boundary. **Named evidence/example:** Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** IUCN-assessment boundary. **Named evidence/example:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible

actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Population-status boundary. **Named evidence/example:** Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Current evidence boundary. **Named evidence/example:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Analytical body:

1. **Claim and named evidence:** Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
2. **Claim and named evidence:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
3. **Claim and named evidence:** Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
4. **Claim and named evidence:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.

Counter-position / limit: A designation, schedule, COP decision, policy target, budget, installed capacity, registration, treatment capacity or chronological association cannot alone establish ecological recovery, compliance, attribution or net climate benefit; test mechanism, monitoring, counterfactual and implementation.

Qualified conclusion: **Claim:** Species-subspecies boundary. **Named evidence/example:** Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** IUCN-assessment boundary. **Named evidence/example:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Population-status boundary. **Named evidence/example:** Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must

retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Current evidence boundary. **Named evidence/example:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Executable exam-length answer / compression plan: For 15 marks, spend one-sixth of the time decoding the directive and drawing definition -> mechanism/status -> institution/instrument -> implementation -> ecological and social outcome; write four to seven claim -> named evidence -> analysis -> qualification points; reserve the final minute for taxon, unit, baseline, date, jurisdiction, exception, causation and residual-risk checks.

Why this earns marks: The answer obeys the directive, explains mechanisms rather than listing schemes, uses India-centric evidence and preserves ecological, species, legal, treaty, institutional, climate-unit, pollution-standard and causal distinctions.

How to improve this answer: For "Explain why population, trend and risk category require separate evidence. Answer in about...", replace the weakest catalogue point with one exact mechanism or distinction, named law/institution/treaty/species, dated status, measurable outcome, implementation constraint and answer-specific qualification.

ORIGINAL MAINS 5 - 20 MARKS

Question: Evaluate a rediscovery or new-sighting claim through a verification protocol. Answer in about 300 words.

Model thesis: Claim: Taxonomic-identity boundary. **Named evidence/example:** Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region.

Analysis: This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Claim: Species-subspecies boundary. **Named evidence/example:** Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another.

Analysis: This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Claim: Range-record boundary. **Named evidence/example:** A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:**

The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** News-notification boundary. **Named evidence/example:**

A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:**

The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Status-verb boundary. **Named evidence/example:** Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. **Analysis:**

This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Rediscovery boundary. **Named evidence/example:**

A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:**

The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

owner. **Claim:** Cross-source reconciliation. **Named evidence/example:** IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Current evidence boundary. **Named evidence/example:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Claim -> named evidence -> analysis -> qualification:

- Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region.
- Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another.
- A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range.
- A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry.
- Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb.
- A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend.
- IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status.
- Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly.

Qualified conclusion: Claim: Taxonomic-identity boundary. **Named evidence/example:** Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Species-subspecies boundary. **Named evidence/example:** Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Range-record boundary. **Named evidence/example:** A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** News-notification boundary. **Named evidence/example:** A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Status-verb boundary. **Named evidence/example:** Observed, reported, assessed, listed, notified,

proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Rediscovery boundary. **Named evidence/example:** A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Cross-source reconciliation. **Named evidence/example:** IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Current evidence boundary. **Named evidence/example:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Demand decoding: The directive **evaluate** requires a direct position on "Evaluate a rediscovery or new-sighting claim through a verification protocol. Answer in about...", every clause, exact ecological mechanism and scale, named Indian law or institution, dated treaty/policy status, evidence, trade-offs and a qualified conclusion.

Detailed examiner-grade model answer:

Introduction and thesis: **Claim:** Taxonomic-identity boundary. **Named evidence/example:** Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Species-subspecies boundary. **Named evidence/example:** Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Range-record boundary. **Named evidence/example:** A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** News-notification boundary. **Named evidence/example:** A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Status-verb boundary. **Named evidence/example:** Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Rediscovery boundary. **Named evidence/example:** A rediscovery or new

locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Cross-source reconciliation. **Named evidence/example:** IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Current evidence boundary. **Named evidence/example:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Analytical body:

1. **Claim and named evidence:** Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
2. **Claim and named evidence:** Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
3. **Claim and named evidence:** A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
4. **Claim and named evidence:** A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
5. **Claim and named evidence:** Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
6. **Claim and named evidence:** A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
7. **Claim and named evidence:** IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or

legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.

8. **Claim and named evidence:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.

Counter-position / limit: A designation, schedule, COP decision, policy target, budget, installed capacity, registration, treatment capacity or chronological association cannot alone establish ecological recovery, compliance, attribution or net climate benefit; test mechanism, monitoring, counterfactual and implementation.

Qualified conclusion: Claim: Taxonomic-identity boundary. **Named evidence/example:** Scientific name, author-accepted taxon and taxonomic rank identify the organism; a common name may refer to more than one taxon or vary by region. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Species-subspecies boundary. **Named evidence/example:** Species, subspecies, population and regional assessment are different units; a claim about one unit must not be transferred to another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Range-record boundary. **Named evidence/example:** A verified range is built from accepted occurrence and distribution evidence; a sighting outside a familiar area may be a record requiring validation, not immediate proof of a stable expanded range. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** News-notification boundary. **Named evidence/example:** A press report or announcement can flag an event, but a legal listing or designation claim requires the applicable official notification, decision or authoritative database entry. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Status-verb boundary. **Named evidence/example:** Observed, reported, assessed, listed, notified, proposed, adopted and entered into force describe different evidence states; tracker wording must preserve the source's verb. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Rediscovery boundary. **Named evidence/example:** A rediscovery or new locality record does not automatically change IUCN status, legal schedule, CITES or CMS listing, total range or population trend. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Cross-source reconciliation. **Named evidence/example:** IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Current evidence boundary. **Named evidence/example:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must

retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Executable exam-length answer / compression plan: For 20 marks, spend one-sixth of the time decoding the directive and drawing definition -> mechanism/status -> institution/instrument -> implementation -> ecological and social outcome; write four to seven claim -> named evidence -> analysis -> qualification points; reserve the final minute for taxon, unit, baseline, date, jurisdiction, exception, causation and residual-risk checks.

Why this earns marks: The answer obeys the directive, explains mechanisms rather than listing schemes, uses India-centric evidence and preserves ecological, species, legal, treaty, institutional, climate-unit, pollution-standard and causal distinctions.

How to improve this answer: For "Evaluate a rediscovery or new-sighting claim through a verification protocol. Answer in about...", replace the weakest catalogue point with one exact mechanism or distinction, named law/institution/treaty/species, dated status, measurable outcome, implementation constraint and answer-specific qualification.

ORIGINAL MAINS 6 - 20 MARKS

Question: Build a static-plus-current species answer without stale or conflated status claims. Answer in about 300 words.

Model thesis: **Claim:** Tracker-record boundary. **Named evidence/example:** A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** IUCN-assessment boundary. **Named evidence/example:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** WPA-legal boundary. **Named evidence/example:** A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CITES-listing boundary. **Named evidence/example:** A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CMS-listing boundary. **Named evidence/example:** A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Endemic-native boundary. **Named evidence/example:** Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Population-status boundary. **Named evidence/example:** Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor

and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Trigger-static boundary. **Named evidence/example:** A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Cross-source reconciliation. **Named evidence/example:** IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Stale-current firewall. **Named evidence/example:** Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Current evidence boundary. **Named evidence/example:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Claim -> named evidence -> analysis -> qualification:

- A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record.
- An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing.
- A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category.
- A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule.
- A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly.
- Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting.
- Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another.
- A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates.
- IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status.
- Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes.
- Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly.

Qualified conclusion: **Claim:** Tracker-record boundary. **Named evidence/example:** A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. **Analysis:** This identifies the environmental mechanism, system

boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** IUCN-assessment boundary. **Named evidence/example:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable.

Qualification: The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** WPA-legal boundary. **Named evidence/example:** A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CITES-listing boundary. **Named evidence/example:** A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CMS-listing boundary. **Named evidence/example:** A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Endemic-native boundary. **Named evidence/example:** Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Population-status boundary. **Named evidence/example:** Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Trigger-static boundary. **Named evidence/example:** A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Cross-source reconciliation. **Named evidence/example:** IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Stale-current firewall. **Named evidence/example:** Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Current evidence boundary. **Named evidence/example:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** This identifies the environmental

mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Demand decoding: The directive **answer** requires a direct position on “Build a static-plus-current species answer without stale or conflated status claims. Answer...”, every clause, exact ecological mechanism and scale, named Indian law or institution, dated treaty/policy status, evidence, trade-offs and a qualified conclusion.

Detailed examiner-grade model answer:

Introduction and thesis: **Claim:** Tracker-record boundary. **Named evidence/example:** A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** IUCN-assessment boundary. **Named evidence/example:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** WPA-legal boundary. **Named evidence/example:** A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CITES-listing boundary. **Named evidence/example:** A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CMS-listing boundary. **Named evidence/example:** A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Endemic-native boundary. **Named evidence/example:** Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Population-status boundary. **Named evidence/example:** Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Trigger-static boundary. **Named evidence/example:** A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Cross-source reconciliation. **Named evidence/example:** IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status.

Analysis: This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** State-current firewall. **Named evidence/example:** Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Current evidence boundary. **Named evidence/example:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Analytical body:

1. **Claim and named evidence:** A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
2. **Claim and named evidence:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
3. **Claim and named evidence:** A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
4. **Claim and named evidence:** A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
5. **Claim and named evidence:** A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
6. **Claim and named evidence:** Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
7. **Claim and named evidence:** Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.

8. **Claim and named evidence:** A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
9. **Claim and named evidence:** IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
10. **Claim and named evidence:** Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.
11. **Claim and named evidence:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** Connect the defined system/taxon and named evidence -> ecological mechanism or legal/institutional instrument -> implementation pathway -> ecological and social consequence. **Qualification:** State scale, stock/flow, parameter/unit, source/date/status, jurisdiction, uncertainty, causal limit, exception or residual risk.

Counter-position / limit: A designation, schedule, COP decision, policy target, budget, installed capacity, registration, treatment capacity or chronological association cannot alone establish ecological recovery, compliance, attribution or net climate benefit; test mechanism, monitoring, counterfactual and implementation.

Qualified conclusion: Claim: Tracker-record boundary. **Named evidence/example:** A species current-affairs record must contain the taxon, claim type, source, publication or assessment date, status verb, verification date and static-topic link; a headline alone is not a record. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** IUCN-assessment boundary. **Named evidence/example:** An IUCN Red List category is an assessment outcome for a stated taxon, geographic scope and assessment version or date; it is not a domestic legal listing. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** WPA-legal boundary. **Named evidence/example:** A Wildlife (Protection) Act schedule entry is a domestic legal classification under the applicable Act and amendment, not an IUCN extinction-risk category. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CITES-listing boundary. **Named evidence/example:** A CITES Appendix listing governs international trade through the Convention's permit system; it does not by itself state IUCN risk or domestic protection schedule. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** CMS-listing boundary. **Named evidence/example:** A CMS Appendix or agreement concerns migratory-species conservation and cooperation; migratory status, Appendix listing and a separate instrument must be recorded distinctly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather

than generalise beyond the owner. **Claim:** Endemic-native boundary. **Named evidence/example:** Endemic means naturally restricted to a defined geographic area, while native means naturally occurring there but possibly elsewhere; neither is inferred from cultural prominence or a single sighting. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Population-status boundary. **Named evidence/example:** Population size, trend, subpopulation structure and extinction-risk category are distinct claims with different evidence and dates; one cannot be inferred from another. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Trigger-static boundary. **Named evidence/example:** A verified current trigger such as a dated assessment, notification, conference decision, survey or rediscovery must be separated from the static taxonomy, ecology and legal framework it illustrates. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Cross-source reconciliation. **Named evidence/example:** IUCN, domestic law, CITES, CMS and taxonomic databases answer different questions and can show different dates without contradiction; reconcile by claim type rather than choosing one universal status. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Stale-current firewall. **Named evidence/example:** Every dated entry should display an as-of or verification date and a recheck trigger; undated words such as current, latest or recently should be avoided in reusable notes. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner. **Claim:** Current evidence boundary. **Named evidence/example:** Species status, range, population, legal schedule, CITES or CMS listing and news trigger require dated official or authoritative source evidence; failed checks and omitted claims must be recorded honestly. **Analysis:** This identifies the environmental mechanism, system boundary, measured parameter, responsible actor and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecological or regulatory scale, temporal stage, rule vintage, legal status, metric and evidence boundary rather than generalise beyond the owner.

Executable exam-length answer / compression plan: For 20 marks, spend one-sixth of the time decoding the directive and drawing definition -> mechanism/status -> institution/instrument -> implementation -> ecological and social outcome; write four to seven claim -> named evidence -> analysis -> qualification points; reserve the final minute for taxon, unit, baseline, date, jurisdiction, exception, causation and residual-risk checks.

Why this earns marks: The answer obeys the directive, explains mechanisms rather than listing schemes, uses India-centric evidence and preserves ecological, species, legal, treaty, institutional, climate-unit, pollution-standard and causal distinctions.

How to improve this answer: For "Build a static-plus-current species answer without stale or conflated status claims. Answer...", replace the weakest catalogue point with one exact mechanism or distinction, named law/institution/treaty/species, dated status, measurable outcome, implementation constraint and answer-specific qualification.
