

SOLVED PRACTICE WORKBOOK

Ecosystem Structure and Function - Learner-v2 Refreshed

UPSC complete learning session | Foundation to advanced | Concepts, evidence, practice and answer writing

Original deterministic study visual; labels are explanatory, not textual quotations.

Source order: repository knowledge -> official current linkage -> clearly marked analysis. No fabricated PYQs or statistics.

CONTENTS / WORKBOOK INDEX

Major learning parts and meaningful subtopics are listed in document order. Page numbers are generated from the final PDF layout; PDF bookmarks mirror the same hierarchy.

Ecosystem Structure and Function - Solved Practice Workbook 5

BASIC MCQS / REMEDIATION 5

Q1. Which statement correctly identifies Ecosystem as a bounded functional unit?	5
Q2. Which option preserves the ecological boundary of Ecosystem as a bounded functional unit?	5
Q3. Which statement uses Ecosystem as a bounded functional unit without changing its scale, parameter or status?	5
Q4. Which option avoids the standard UPSC close-option trap about Ecosystem as a bounded functional unit?	6
Q5. Which statement correctly identifies Biotic and abiotic structure?	6
Q6. Which option preserves the ecological boundary of Biotic and abiotic structure?	6
Q7. Which statement uses Biotic and abiotic structure without changing its scale, parameter or status?	6
Q8. Which option avoids the standard UPSC close-option trap about Biotic and abiotic structure?	7
Q9. Which statement correctly identifies Producer entry point?	7
Q10. Which option preserves the ecological boundary of Producer entry point?	7
Q11. Which statement uses Producer entry point without changing its scale, parameter or status?	8
Q12. Which option avoids the standard UPSC close-option trap about Producer entry point?	8
Q13. Which statement correctly identifies Consumers and trophic position?	8
Q14. Which option preserves the ecological boundary of Consumers and trophic position?	8
Q15. Which statement uses Consumers and trophic position without changing its scale, parameter or status?	9
Q16. Which option avoids the standard UPSC close-option trap about Consumers and trophic position?	9
Q17. Which statement correctly identifies Detritivore and decomposer distinction?	9
Q18. Which option preserves the ecological boundary of Detritivore and decomposer distinction?	10
Q19. Which statement uses Detritivore and decomposer distinction without changing its scale, parameter or status?	10
Q20. Which option avoids the standard UPSC close-option trap about Detritivore and decomposer distinction?	10
Q21. Which statement correctly identifies Energy movement versus matter cycling?	11
Q22. Which option preserves the ecological boundary of Energy movement versus matter cycling?	11
Q23. Which statement uses Energy movement versus matter cycling without changing its scale, parameter or status?	11
Q24. Which option avoids the standard UPSC close-option trap about Energy movement versus matter cycling?	11
Q25. Which statement correctly identifies Food chain versus food web?	12
Q26. Which option preserves the ecological boundary of Food chain versus food web?	12
Q27. Which statement uses Food chain versus food web without changing its scale, parameter or status?	12

Q28. Which option avoids the standard UPSC close-option trap about Food chain versus food web?	13
Q29. Which statement correctly identifies Habitat, niche and niche dimensions?	13
Q30. Which option preserves the ecological boundary of Habitat, niche and niche dimensions?	13
Q31. Which statement uses Habitat, niche and niche dimensions without changing its scale, parameter or status?	13
Q32. Which option avoids the standard UPSC close-option trap about Habitat, niche and niche dimensions?	14
Q33. Which statement correctly identifies Ecotone and edge effect?	14
Q34. Which option preserves the ecological boundary of Ecotone and edge effect?	14
Q35. Which statement uses Ecotone and edge effect without changing its scale, parameter or status?	15
Q36. Which option avoids the standard UPSC close-option trap about Ecotone and edge effect?	15
Q37. Which statement correctly identifies Stratification and resource partitioning?	15
Q38. Which option preserves the ecological boundary of Stratification and resource partitioning?	15
Q39. Which statement uses Stratification and resource partitioning without changing its scale, parameter or status?	16
Q40. Which option avoids the standard UPSC close-option trap about Stratification and resource partitioning?	16
Q41. Which statement correctly identifies Gross and net primary productivity?	16
Q42. Which option preserves the ecological boundary of Gross and net primary productivity?	17
Q43. Which statement uses Gross and net primary productivity without changing its scale, parameter or status?	17
Q44. Which option avoids the standard UPSC close-option trap about Gross and net primary productivity?	17
Q45. Which statement correctly identifies Standing crop and standing state?	18
Q46. Which option preserves the ecological boundary of Standing crop and standing state?	18
Q47. Which statement uses Standing crop and standing state without changing its scale, parameter or status?	18
Q48. Which option avoids the standard UPSC close-option trap about Standing crop and standing state?	19
Q49. Which statement correctly identifies Stability and resilience?	19
Q50. Which option preserves the ecological boundary of Stability and resilience?	19
Q51. Which statement uses Stability and resilience without changing its scale, parameter or status?	19
Q52. Which option avoids the standard UPSC close-option trap about Stability and resilience?	20
Q53. Which statement correctly identifies Ecosystem services and NCP?	20
Q54. Which option preserves the ecological boundary of Ecosystem services and NCP?	20
Q55. Which statement uses Ecosystem services and NCP without changing its scale, parameter or status?	21
Q56. Which option avoids the standard UPSC close-option trap about Ecosystem services and NCP?	21
Q57. Which statement correctly identifies Carrying capacity?	21
Q58. Which option preserves the ecological boundary of Carrying capacity?	22
Q59. Which statement uses Carrying capacity without changing its scale, parameter or status?	22

Q60. Which option avoids the standard UPSC close-option trap about Carrying capacity?	22
Q61. Which statement correctly identifies Interaction and coevolution PYQ routes?	22
Q62. Which option preserves the ecological boundary of Interaction and coevolution PYQ routes?	23
Q63. Which statement uses Interaction and coevolution PYQ routes without changing its scale, parameter or status?	23
Q64. Which option avoids the standard UPSC close-option trap about Interaction and coevolution PYQ routes?	23
Q65. Which statement correctly identifies Ocean producers, filter feeders and detritivores?	24
Q66. Which option preserves the ecological boundary of Ocean producers, filter feeders and detritivores?	24
Q67. Which statement uses Ocean producers, filter feeders and detritivores without changing its scale, parameter or status?	24
Q68. Which option avoids the standard UPSC close-option trap about Ocean producers, filter feeders and detritivores?	25
Q69. Which statement correctly identifies Wetland filtering as structure-function evidence?	25
Q70. Which option preserves the ecological boundary of Wetland filtering as structure-function evidence?	25
Q71. Which statement uses Wetland filtering as structure-function evidence without changing its scale, parameter or status?	26
Q72. Which option avoids the standard UPSC close-option trap about Wetland filtering as structure-function evidence?	26
Q73. Which statement correctly identifies Extent versus ecosystem quality?	26
Q74. Which option preserves the ecological boundary of Extent versus ecosystem quality?	27
Q75. Which statement uses Extent versus ecosystem quality without changing its scale, parameter or status?	27
Q76. Which option avoids the standard UPSC close-option trap about Extent versus ecosystem quality?	27
Q77. Which statement correctly identifies Institution and evidence boundary?	28
Q78. Which option preserves the ecological boundary of Institution and evidence boundary?	28
Q79. Which statement uses Institution and evidence boundary without changing its scale, parameter or status?	28
Q80. Which option avoids the standard UPSC close-option trap about Institution and evidence boundary?	29

Ecosystem Structure and Function - Solved Practice Workbook

BASIC MCQS / REMEDIATION

Q1. Which statement correctly identifies Ecosystem as a bounded functional unit?

A. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. B. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. C. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. D. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank.

Answer: A. Explanation: The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q2. Which option preserves the ecological boundary of Ecosystem as a bounded functional unit?

A. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. B. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. C. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. D. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point.

Answer: B. Explanation: The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q3. Which statement uses Ecosystem as a bounded functional unit without changing its scale, parameter or status?

A. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. B. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. C. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. D. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms.

Answer: C. Explanation: The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q4. Which option avoids the standard UPSC close-option trap about Ecosystem as a bounded functional unit?

A. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. B. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. C. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. D. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit.

Answer: D. Explanation: The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q5. Which statement correctly identifies Biotic and abiotic structure?

A. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. B. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. C. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. D. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point.

Answer: A. Explanation: Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q6. Which option preserves the ecological boundary of Biotic and abiotic structure?

A. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. B. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. C. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. D. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms.

Answer: B. Explanation: Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q7. Which statement uses Biotic and abiotic structure without changing its scale, parameter or status?

A. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. B. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. C. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. D. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients;

the two roles cooperate but are not synonyms.

Answer: C. Explanation: Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q8. Which option avoids the standard UPSC close-option trap about Biotic and abiotic structure?

A. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. B. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. C. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. D. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do.

Answer: D. Explanation: Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q9. Which statement correctly identifies Producer entry point?

A. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. B. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. C. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. D. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are.

Answer: A. Explanation: Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q10. Which option preserves the ecological boundary of Producer entry point?

A. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. B. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. C. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. D. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms.

Answer: B. Explanation: Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q11. Which statement uses Producer entry point without changing its scale, parameter or status?

A. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. B. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. C. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. D. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche.

Answer: C. Explanation: Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q12. Which option avoids the standard UPSC close-option trap about Producer entry point?

A. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. B. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. C. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. D. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point.

Answer: D. Explanation: Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q13. Which statement correctly identifies Consumers and trophic position?

A. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. B. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. C. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. D. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are.

Answer: A. Explanation: Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q14. Which option preserves the ecological boundary of Consumers and trophic position?

A. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. B. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. C. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. D. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless.

Answer: B. Explanation: Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q15. Which statement uses Consumers and trophic position without changing its scale, parameter or status?

A. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. B. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. C. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. D. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone.

Answer: C. Explanation: Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q16. Which option avoids the standard UPSC close-option trap about Consumers and trophic position?

A. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. B. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. C. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. D. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank.

Answer: D. Explanation: Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q17. Which statement correctly identifies Detritivore and decomposer distinction?

A. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. B. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. C. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. D. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are.

Answer: A. Explanation: Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q18. Which option preserves the ecological boundary of Detritivore and decomposer distinction?

A. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. B. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. C. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. D. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless.

Answer: B. Explanation: Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q19. Which statement uses Detritivore and decomposer distinction without changing its scale, parameter or status?

A. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. B. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. C. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. D. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche.

Answer: C. Explanation: Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q20. Which option avoids the standard UPSC close-option trap about Detritivore and decomposer distinction?

A. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. B. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. C. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. D. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms.

Answer: D. Explanation: Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q21. Which statement correctly identifies Energy movement versus matter cycling?

A. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. B. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. C. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. D. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless.

Answer: A. Explanation: Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q22. Which option preserves the ecological boundary of Energy movement versus matter cycling?

A. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. B. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. C. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. D. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche.

Answer: B. Explanation: Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q23. Which statement uses Energy movement versus matter cycling without changing its scale, parameter or status?

A. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. B. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. C. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. D. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers.

Answer: C. Explanation: Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q24. Which option avoids the standard UPSC close-option trap about Energy movement versus matter cycling?

A. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. B. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. C. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. D. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are.

Answer: D. Explanation: Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q25. Which statement correctly identifies Food chain versus food web?

A. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. B. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. C. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. D. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche.

Answer: A. Explanation: A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q26. Which option preserves the ecological boundary of Food chain versus food web?

A. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. B. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. C. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. D. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone.

Answer: B. Explanation: A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q27. Which statement uses Food chain versus food web without changing its scale, parameter or status?

A. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. B. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. C. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. D. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate.

Answer: C. Explanation: A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q28. Which option avoids the standard UPSC close-option trap about Food chain versus food web?

A. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. B. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. C. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. D. A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless.

Answer: D. Explanation: A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q29. Which statement correctly identifies Habitat, niche and niche dimensions?

A. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. B. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. C. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. D. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity.

Answer: A. Explanation: Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q30. Which option preserves the ecological boundary of Habitat, niche and niche dimensions?

A. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. B. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. C. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. D. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers.

Answer: B. Explanation: Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q31. Which statement uses Habitat, niche and niche dimensions without changing its scale, parameter or status?

A. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. B. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. C. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. D. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem;

neither is a productivity rate.

Answer: C. Explanation: Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q32. Which option avoids the standard UPSC close-option trap about Habitat, niche and niche dimensions?

A. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. B. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. C. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. D. Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche.

Answer: D. Explanation: Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q33. Which statement correctly identifies Ecotone and edge effect?

A. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. B. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. C. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. D. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity.

Answer: A. Explanation: An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q34. Which option preserves the ecological boundary of Ecotone and edge effect?

A. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. B. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. C. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. D. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers.

Answer: B. Explanation: An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q35. Which statement uses Ecotone and edge effect without changing its scale, parameter or status?

A. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. B. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. C. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. D. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate.

Answer: C. Explanation: An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q36. Which option avoids the standard UPSC close-option trap about Ecotone and edge effect?

A. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. B. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. C. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. D. An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone.

Answer: D. Explanation: An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q37. Which statement correctly identifies Stratification and resource partitioning?

A. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. B. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. C. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. D. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate.

Answer: A. Explanation: Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q38. Which option preserves the ecological boundary of Stratification and resource partitioning?

A. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. B. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. C. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. D. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock.

Answer: B. Explanation: Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q39. Which statement uses Stratification and resource partitioning without changing its scale, parameter or status?

A. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. B. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. C. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. D. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values.

Answer: C. Explanation: Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q40. Which option avoids the standard UPSC close-option trap about Stratification and resource partitioning?

A. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. B. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. C. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. D. Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity.

Answer: D. Explanation: Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q41. Which statement correctly identifies Gross and net primary productivity?

A. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. B. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. C. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. D. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock.

Answer: A. Explanation: Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q42. Which option preserves the ecological boundary of Gross and net primary productivity?

A. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. B. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. C. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. D. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values.

Answer: B. Explanation: Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q43. Which statement uses Gross and net primary productivity without changing its scale, parameter or status?

A. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. B. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. C. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. D. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount.

Answer: C. Explanation: Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q44. Which option avoids the standard UPSC close-option trap about Gross and net primary productivity?

A. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. B. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. C. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. D. Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers.

Answer: D. Explanation: Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q45. Which statement correctly identifies Standing crop and standing state?

A. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. B. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. C. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. D. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock.

Answer: A. Explanation: Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q46. Which option preserves the ecological boundary of Standing crop and standing state?

A. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. B. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. C. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. D. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount.

Answer: B. Explanation: Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q47. Which statement uses Standing crop and standing state without changing its scale, parameter or status?

A. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. B. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. C. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. D. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list.

Answer: C. Explanation: Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q48. Which option avoids the standard UPSC close-option trap about Standing crop and standing state?

A. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. B. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. C. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. D. Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate.

Answer: D. Explanation: Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q49. Which statement correctly identifies Stability and resilience?

A. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. B. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. C. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. D. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount.

Answer: A. Explanation: Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q50. Which option preserves the ecological boundary of Stability and resilience?

A. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. B. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. C. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. D. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred.

Answer: B. Explanation: Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q51. Which statement uses Stability and resilience without changing its scale, parameter or status?

A. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. B. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. C. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. D. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not

justify an unsupported universal removal percentage.

Answer: C. Explanation: Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q52. Which option avoids the standard UPSC close-option trap about Stability and resilience?

A. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. B. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. C. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. D. Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock.

Answer: D. Explanation: Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q53. Which statement correctly identifies Ecosystem services and NCP?

A. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. B. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. C. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. D. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list.

Answer: A. Explanation: The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q54. Which option preserves the ecological boundary of Ecosystem services and NCP?

A. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. B. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. C. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. D. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred.

Answer: B. Explanation: The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q55. Which statement uses Ecosystem services and NCP without changing its scale, parameter or status?

A. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. B. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. C. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. D. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage.

Answer: C. Explanation: The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q56. Which option avoids the standard UPSC close-option trap about Ecosystem services and NCP?

A. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. B. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. C. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. D. The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values.

Answer: D. Explanation: The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q57. Which statement correctly identifies Carrying capacity?

A. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. B. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. C. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. D. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred.

Answer: A. Explanation: Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q58. Which option preserves the ecological boundary of Carrying capacity?

A. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. B. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. C. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. D. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage.

Answer: B. Explanation: Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q59. Which statement uses Carrying capacity without changing its scale, parameter or status?

A. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. B. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. C. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. D. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims.

Answer: C. Explanation: Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q60. Which option avoids the standard UPSC close-option trap about Carrying capacity?

A. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. B. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. C. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. D. Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount.

Answer: D. Explanation: Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q61. Which statement correctly identifies Interaction and coevolution PYQ routes?

A. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. B. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. C. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. D. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage.

Answer: A. Explanation: The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q62. Which option preserves the ecological boundary of Interaction and coevolution PYQ routes?

A. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. B. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. C. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. D. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage.

Answer: B. Explanation: The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q63. Which statement uses Interaction and coevolution PYQ routes without changing its scale, parameter or status?

A. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. B. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. C. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. D. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim.

Answer: C. Explanation: The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q64. Which option avoids the standard UPSC close-option trap about Interaction and coevolution PYQ routes?

A. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. B. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. C. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. D. The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred.

Answer: D. Explanation: The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q65. Which statement correctly identifies Ocean producers, filter feeders and detritivores?

A. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. B. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. C. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. D. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims.

Answer: A. Explanation: The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q66. Which option preserves the ecological boundary of Ocean producers, filter feeders and detritivores?

A. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. B. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. C. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. D. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit.

Answer: B. Explanation: The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q67. Which statement uses Ocean producers, filter feeders and detritivores without changing its scale, parameter or status?

A. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. B. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. C. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. D. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do.

Answer: C. Explanation: The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q68. Which option avoids the standard UPSC close-option trap about Ocean producers, filter feeders and detritivores?

A. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. B. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. C. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. D. The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list.

Answer: D. Explanation: The audited routes require primary producers in ocean food chains, filter-feeding organisms and detritivore function to remain in Basic practice; each is a functional role and not a claim about one universal species list. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q69. Which statement correctly identifies Wetland filtering as structure-function evidence?

A. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. B. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. C. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. D. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims.

Answer: A. Explanation: Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q70. Which option preserves the ecological boundary of Wetland filtering as structure-function evidence?

A. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. B. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. C. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. D. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim.

Answer: B. Explanation: Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q71. Which statement uses Wetland filtering as structure-function evidence without changing its scale, parameter or status?

A. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. B. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. C. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. D. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do.

Answer: C. Explanation: Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q72. Which option avoids the standard UPSC close-option trap about Wetland filtering as structure-function evidence?

A. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. B. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. C. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. D. Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage.

Answer: D. Explanation: Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q73. Which statement correctly identifies Extent versus ecosystem quality?

A. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. B. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. C. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. D. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim.

Answer: A. Explanation: Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q74. Which option preserves the ecological boundary of Extent versus ecosystem quality?

A. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. B. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. C. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. D. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do.

Answer: B. Explanation: Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q75. Which statement uses Extent versus ecosystem quality without changing its scale, parameter or status?

A. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. B. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. C. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. D. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point.

Answer: C. Explanation: Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q76. Which option avoids the standard UPSC close-option trap about Extent versus ecosystem quality?

A. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. B. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. C. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. D. Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims.

Answer: D. Explanation: Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q77. Which statement correctly identifies Institution and evidence boundary?

A. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. B. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. C. The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. D. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do.

Answer: A. Explanation: MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q78. Which option preserves the ecological boundary of Institution and evidence boundary?

A. Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. B. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. C. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. D. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank.

Answer: B. Explanation: MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q79. Which statement uses Institution and evidence boundary without changing its scale, parameter or status?

A. Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. B. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. C. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. D. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank.

Answer: C. Explanation: MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

Q80. Which option avoids the standard UPSC close-option trap about Institution and evidence boundary?

A. Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. B. Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. C. Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. D. MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim.

Answer: D. Explanation: MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. The other options belong to different ecological levels, parameters, processes, scales, institutions or status categories.

PYQS AND ANSWER PRACTICE

VERIFIED PYQ OWNERSHIP AUDIT

The audited owners route the 2019 GS-III carrying-capacity demand directly to this topic and route objective concepts on primary producers, filter feeders, detritivores, symbiosis, parasitoids, fig pollination and wetland function. The direct Mains demand is solved as a demand card; objective routes remain answer-free because this package does not infer an official option or key.

OWNER PYQ LEDGER EXTRACTS

9. PYQ application

- ANALYSIS: Recurring Prelims pattern: identify correct statements on energy flow, trophic levels and decomposer function using elimination against the traps above.
- ANALYSIS: Mains linkage: ecosystem-services framing (provisioning, regulating, supporting, cultural) is used to justify conservation and EIA arguments across GS-III.

Recent PYQ Integration (2024-2025)

Status: 2024-2025 question-level PYQ demand is integrated into this owner. **Provenance:** Audited local official-paper routing ledgers: _PYQ-ROUTING-PRELIMS-2024-2025.md. **Answer-key rule:** The official 2024-2025 Prelims Set-A keys are present in the repository and CSAT Set-A keys are supplied; even so, no option or answer is recorded or inferred in this integration.

- **Years represented:** 2024, 2025
- **Paper(s):** Prelims GS-I
- **Routed question demands:** 3

Year	Paper	Q	PYQ demand (neutral rendering)	Directive / format	Source status	Owner requirement
2024	Prelims GS-I	18	Parasitoid species among organisms (carabid beetles, centipedes, flies, termites, wasps)	Objective question; official Set-A key available locally, answer not inferred	Key available locally (official Set-A answer key present); answer not recorded here	Cover the named fact/concept and its likely statement-level distinctions.
2024	Prelims GS-I	28	Tree uniquely pollinated by a coevolved insect (fig)	Objective question; official Set-A key available locally, answer not inferred	Key available locally (official Set-A answer key present); answer not recorded here	Cover the named fact/concept and its likely statement-level distinctions.

Year	Paper	Q	PYQ demand (neutral rendering)	Directive / format	Source status	Owner requirement
2025	Prelims GS-I	40	Sources of the planet's oxygen (rainforests, phytoplankton, surface water)	Objective question; official Set-A key available locally, answer not inferred	Key available locally (official Set-A answer key present); answer not recorded here	Cover the named fact/concept and its likely statement-level distinctions.

What this owner must now support

- Parasitoid species among organisms (carabid beetles, centipedes, flies, termites, wasps)
- Tree uniquely pollinated by a coevolved insect (fig)
- Sources of the planet's oxygen (rainforests, phytoplankton, surface water)

This block integrates the 2024-2025 examinable demand and paper metadata. It is kept separate from the 2018-2023 block and does not convert an unkeyed/answer-free objective question into a solved answer.

Historical PYQ Integration (2018-2023)

Status: Question-level PYQ demand is integrated into this owner. **Provenance:** Audited local official-paper routing ledgers: _PYQ-ROUTING-MAINS-GS3-GS4-2018-2023.md, _PYQ-ROUTING-PRELIMS-2018-2023.md.

Answer-key rule: The official 2018-2023 Prelims/CSAT keys are not held locally; no option or answer has been inferred.

- **Years represented:** 2019, 2021, 2022
- **Paper(s):** GS-III, Prelims GS-I
- **Routed question demands:** 8

Year	Paper	Q	PYQ demand (neutral rendering)	Directive / format	Source status	Owner requirement
2019	GS-III	17	Ecosystem carrying capacity concept and sustainable development planning	Define · 15 marks · 250 words	Routed to owning topic	Prepare context, core dimensions, evidence/examples, counterpoint and a concise conclusion.
2019	Prelims GS-I	28	Marine and reptile animal dietary and reproductive characteristics	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2021	Prelims GS-I	22	Primary producers in ocean food chains	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2021	Prelims GS-I	26	Filter feeder organisms in marine ecology	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2021	Prelims GS-I	28	Detritivores and their role in decomposition	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2021	Prelims GS-I	30	Organisms capable of establishing symbiotic relationships	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2022	Prelims GS-I	43	Wetland ecosystem filtering and heavy metal absorption functions	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2022	Prelims GS-I	90	Species known for cultivating fungi symbiotic relationship	Objective question; official key unavailable locally	Routed; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.

What this owner must now support

- Ecosystem carrying capacity concept and sustainable development planning
- Marine and reptile animal dietary and reproductive characteristics
- Primary producers in ocean food chains
- Filter feeder organisms in marine ecology
- Detritivores and their role in decomposition
- Organisms capable of establishing symbiotic relationships
- Wetland ecosystem filtering and heavy metal absorption functions
- Species known for cultivating fungi symbiotic relationship

The table integrates the examinable demand and paper metadata. It does not turn an unkeyed objective question into a solved answer, and it does not claim that lexical presence alone proves full conceptual sufficiency.

10. PYQ-based analytical application

- ANALYSIS: Trophic-level and energy-flow statement-based Prelims questions are answered fastest by applying the one-way-energy / cyclic-matter rule and the ecological-efficiency figure.
- ANALYSIS: Mains questions on "ecosystem services" or "valuing nature" expect the four-category framework plus a governance-gap critique (Section 4-5 above), not a textbook definition.

Historical PYQ Integration (2018-2023)

Status: Question-level PYQ demand is integrated into this owner. **Provenance:** Audited local official-paper routing ledgers: _PYQ-ROUTING-MAINS-GS3-GS4-2018-2023.md.

- **Years represented:** 2019
- **Paper(s):** GS-III

What this owner must now support

- Ecosystem carrying capacity concept and sustainable development planning

The table integrates the examinable demand and paper metadata. It does not turn an unkeyed objective question into a solved answer, and it does not claim that lexical presence alone proves full conceptual sufficiency.

PYQ DEMAND CARD 1 - 2019 GS-III, Question 17

Demand: Define ecosystem carrying capacity and explain its relevance to sustainable development planning.

Status: Verified routed Mains demand; model answer is original and not an official UPSC solution.

Model solution: Ecosystem as a bounded functional unit: The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. **Stability and resilience:** Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. **Carrying capacity:** Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. **Wetland filtering as structure-function evidence:** Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed

wetland function does not justify an unsupported universal removal percentage. **Extent versus ecosystem quality:** Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. The answer therefore separates definition, mechanism, evidence and limitation, and does not infer an official model answer or objective key.

ORIGINAL MAINS 1 - 10 MARKS

Question: Explain why energy flow is unidirectional while matter cycles in an ecosystem. Answer in about 150 words.

Model thesis: **Claim:** Producer entry point. **Named evidence/example:** Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Detritivore and decomposer distinction. **Named evidence/example:** Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms.

Analysis: This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner.

Claim: Energy movement versus matter cycling. **Named evidence/example:** Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner.

Claim -> named evidence -> analysis -> qualification:

- Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point.
- Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms.
- Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are.

Qualified conclusion: **Claim:** Producer entry point. **Named evidence/example:** Producers introduce usable chemical energy through photosynthesis or chemosynthesis; green plants are not the only producers, and the source does not support treating consumers or decomposers as an energy entry point. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable.

Qualification: The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Detritivore and decomposer distinction. **Named evidence/example:** Detritivores physically fragment dead organic material, whereas microbial decomposers such as bacteria and fungi chemically break it down and release nutrients; the two roles cooperate but are not synonyms. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Energy movement versus matter cycling. **Named evidence/example:** Energy passes one way through trophic transfers and dissipates as heat, whereas chemical matter returns through decomposition and uptake; energy is not recycled merely because nutrients are. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable.

Qualification: The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner.

ORIGINAL MAINS 2 - 10 MARKS

Question: Distinguish habitat, niche, ecotone and edge effect. Answer in about 150 words.

Model thesis: **Claim:** Habitat, niche and niche dimensions. **Named evidence/example:** Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Ecotone and edge effect. **Named evidence/example:** An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner.

Claim -> named evidence -> analysis -> qualification:

- Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche.
- An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone.

Qualified conclusion: **Claim:** Habitat, niche and niche dimensions. **Named evidence/example:** Habitat is the physical place a species occupies, while niche is its functional resource use and interactions; the owner separates habitat, trophic or food, and reproductive dimensions of niche. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Ecotone and edge effect. **Named evidence/example:** An ecotone is a transition zone of variable width between adjoining ecosystems and may show an edge effect, but the higher density or variety often associated with an edge is a pattern, not the definition of the zone. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner.

ORIGINAL MAINS 3 - 15 MARKS

Question: Define ecosystem carrying capacity and explain its relevance to sustainable planning. Answer in about 250 words.

Model thesis: **Claim:** Ecosystem as a bounded functional unit. **Named evidence/example:** The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Stability and resilience. **Named evidence/example:** Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Carrying capacity. **Named evidence/example:** Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Extent versus ecosystem quality. **Named evidence/example:** Forest or tree-cover extent is

a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner.

Claim -> named evidence -> analysis -> qualification:

- The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit.
- Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock.
- Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount.
- Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims.

Qualified conclusion: Claim: Ecosystem as a bounded functional unit. **Named evidence/example:** The owner defines an ecosystem as interacting biotic communities and their abiotic physical and chemical environment exchanging energy and matter; A. G. Tansley coined the term in 1935, and every claim must state the practical system boundary rather than treat all nature as one unit. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Stability and resilience. **Named evidence/example:** Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Carrying capacity. **Named evidence/example:** Carrying capacity is the population or project load an ecosystem can sustain over time without eroding regenerative functions; it is a conditional threshold shaped by consumption, technology and governance, not a fixed headcount. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Extent versus ecosystem quality. **Named evidence/example:** Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner.

ORIGINAL MAINS 4 - 15 MARKS

Question: Analyse how ecosystem structure enables ecosystem services. Answer in about 250 words.

Model thesis: Claim: Biotic and abiotic structure. **Named evidence/example:** Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Stratification and resource partitioning. **Named evidence/example:** Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. **Analysis:** This identifies the ecological mechanism, system boundary, state variable

and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Ecosystem services and NCP. **Named evidence/example:** The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Wetland filtering as structure-function evidence. **Named evidence/example:** Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner.

Claim -> named evidence -> analysis -> qualification:

- Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do.
- Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity.
- The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values.
- Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage.

Qualified conclusion: **Claim:** Biotic and abiotic structure. **Named evidence/example:** Biotic structure comprises producers, consumers, decomposers and detritivores, while abiotic structure comprises climatic, edaphic, water and nutrient conditions; structure identifies what is present before function explains what those components do. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Stratification and resource partitioning. **Named evidence/example:** Vertical layering such as canopy, understorey, shrub and forest floor creates different microhabitats and niches; greater layering may support coexistence without proving universal stability or biodiversity. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Ecosystem services and NCP. **Named evidence/example:** The owner uses provisioning, regulating, supporting and cultural services as the Millennium Ecosystem Assessment vocabulary, while IPBES Nature's Contributions to People broadens valuation to relational and indigenous or local-knowledge values. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Wetland filtering as structure-function evidence. **Named evidence/example:** Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner.

ORIGINAL MAINS 5 - 20 MARKS

Question: Assess whether food-web complexity necessarily guarantees ecosystem resilience. Answer in about 300 words.

Model thesis: Claim: Consumers and trophic position. **Named evidence/example:** Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Food chain versus food web.

Named evidence/example: A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless.

Analysis: This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner.

Claim: Stability and resilience. **Named evidence/example:** Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Interaction and coevolution PYQ routes. **Named**

evidence/example: The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred.

Analysis: This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner.

Claim -> named evidence -> analysis -> qualification:

- Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank.
- A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless.
- Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock.
- The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred.

Qualified conclusion: Claim: Consumers and trophic position. **Named evidence/example:** Consumers obtain energy from other organisms and may occupy more than one trophic position when omnivory occurs, so trophic level is a feeding relation within the stated web rather than a permanent taxonomic rank. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable.

Qualification: The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Food chain versus food web. **Named evidence/example:** A food chain is one linear feeding route, while a food web is the network of interconnected chains; alternative links can support resilience, but a web does not make every disturbance harmless. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Stability and resilience. **Named evidence/example:** Stability or resistance describes limited change under disturbance, whereas resilience describes recovery after disturbance; a uniform plantation can appear stable yet remain poorly resilient to a specific shock. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Interaction and coevolution PYQ routes. **Named**

evidence/example: The Basic owner carries routed objective concepts on parasitoids, fig pollination, symbiosis and fungus cultivation; these are interaction types within ecological networks, and no official answer option is inferred.

Analysis: This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner.

ORIGINAL MAINS 6 - 20 MARKS

Question: Evaluate the limits of using forest or tree cover as a proxy for ecosystem health. Answer in about 300 words.

Model thesis: Claim: Gross and net primary productivity. **Named evidence/example:** Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Standing crop and standing state. **Named evidence/example:** Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Wetland filtering as structure-function evidence. **Named evidence/example:** Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Extent versus ecosystem quality. **Named evidence/example:** Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Institution and evidence boundary. **Named evidence/example:** MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner.

Claim -> named evidence -> analysis -> qualification:

- Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers.
- Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate.
- Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage.
- Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims.
- MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim.

Qualified conclusion: Claim: Gross and net primary productivity. **Named evidence/example:** Gross primary productivity is total producer fixation over time, while net primary productivity is gross primary productivity minus producer respiration and is the production available for growth and consumers. **Analysis:** This identifies the ecological

mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Standing crop and standing state. **Named evidence/example:** Standing crop is living material present at a stated time and is often expressed as biomass or number, whereas standing state is the quantity of an abiotic nutrient in the ecosystem; neither is a productivity rate. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Wetland filtering as structure-function evidence. **Named evidence/example:** Wetland vegetation, sediments and microbial processes can retain or transform pollutants and support flood regulation, but a routed wetland function does not justify an unsupported universal removal percentage. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Extent versus ecosystem quality. **Named evidence/example:** Forest or tree-cover extent is a canopy measure and cannot by itself establish native composition, age structure, biodiversity, resilience or ecosystem functioning; extent and ecological quality are different claims. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner. **Claim:** Institution and evidence boundary. **Named evidence/example:** MoEFCC, WII, BSI, ZSI and FSI occupy different policy, research, taxonomic and monitoring roles; the owner and audited routing ledgers remain primary, while thin live pages and unavailable answer keys add no claim. **Analysis:** This identifies the ecological mechanism, system boundary, state variable and causal link that make the claim examinable. **Qualification:** The conclusion must retain the source's ecosystem, trophic parameter, spatial scale, temporal stage, taxonomic level, legal status and evidence boundary rather than generalise beyond the owner.
