

COMPLETE LEARNING SESSION

Public Finance and Service-Delivery Tools - Learner-v2 Refreshed

UPSC complete learning session | Foundation to advanced | Concepts, evidence, practice and answer writing

Original deterministic study visual; labels are explanatory, not textual quotations.

Source order: repository knowledge -> official current linkage -> clearly marked analysis. No fabricated PYQs or statistics.

CONTENTS / SESSION INDEX

Major learning parts and meaningful subtopics are listed in document order. Page numbers are generated from the final PDF layout; PDF bookmarks mirror the same hierarchy.

Public Finance and Service-Delivery Tools - Learner-v2 Complete Learning Session 6

SOURCE, PROGRESSION AND CURRENT-LINKAGE AUDIT 6

BASIC LEARNING SESSION 7

SESSION 1 - FOUNDATION - THE BUDGET-TO-BENEFICIARY CHAIN THIS TOPIC OWNS 7

SESSION 2 - FOUNDATION - THE IDENTITY AND PAYMENTS FOUNDATION 9

SESSION 3 - FOUNDATION - WHAT AUTHENTICATED TRANSFER ACTUALLY REFORMED 11

SESSION 4 - CORE - THE FUND-TRACKING LAYER AND ITS OWN LEAKAGE RISK 13

SESSION 5 - CORE - FROM THE SINGLE NODAL AGENCY MODEL TO SNA-SPARSH 14

SESSION 6 - CORE - SETTLEMENT INFRASTRUCTURE AND THE PROCEDURAL RULEBOOK 16

SESSION 7 - CORE - THREE DIFFERENT FAILURES AND THREE DIFFERENT INSTRUMENTS 18

SESSION 8 - CORE - INCLUSION ERROR AND EXCLUSION ERROR 20

SESSION 9 - CORE - WHICH ERROR THE DESIGN IS WILLING TO BEAR 22

SESSION 10 - CORE - WHY A SAVINGS FIGURE IS NOT A WELFARE GAIN 23

SESSION 11 - CORE - LOCATING A DEMAND ON THE SIX-STAGE CHAIN 25

SESSION 12 - CORE - PROCUREMENT FAILURE BEYOND CORRUPTION 27

SESSION 13 - CORE SYNTHESIS - RULES, CAPACITY AND THE LIMITS OF A RULEBOOK 29

SESSION 14 - CORE SYNTHESIS - JUST-IN-TIME RELEASE AND LOCAL-BODY FINANCE 30

SESSION 15 - CORE SYNTHESIS - OUTCOME MEASUREMENT, DATA QUALITY AND OWNERSHIP 32

BASIC MCQS / REMEDIATION 42

Q1. Which statement correctly identifies The budget-to-beneficiary chain this owner holds? 42

Q2. Which chronology card should be filed under The budget-to-beneficiary chain this owner holds? 43

Q3. Which option preserves the source-bounded meaning of The budget-to-beneficiary chain this owner holds? 44

Q4. Which statement avoids a close-option trap about The budget-to-beneficiary chain this owner holds? 44

Q5. Which statement correctly identifies The identity and payments foundation named JAM? 45

Q6. Which chronology card should be filed under The identity and payments foundation named JAM? 46

Q7. Which option preserves the source-bounded meaning of The identity and payments foundation named JAM? 46

Q8. Which statement avoids a close-option trap about The identity and payments foundation named JAM? 47

Q9. Which statement correctly identifies Direct Benefit Transfer is a payments reform broader than cash? 48

Q10. Which chronology card should be filed under Direct Benefit Transfer is a payments reform broader than cash? 48

Q11. Which option preserves the source-bounded meaning of Direct Benefit Transfer is a payments reform broader than cash?	49
Q12. Which statement avoids a close-option trap about Direct Benefit Transfer is a payments reform broader than cash?	50
Q13. Which statement correctly identifies The Public Financial Management System and the agency layer?	50
Q14. Which chronology card should be filed under The Public Financial Management System and the agency layer?	51
Q15. Which option preserves the source-bounded meaning of The Public Financial Management System and the agency layer?	51
Q16. Which statement avoids a close-option trap about The Public Financial Management System and the agency layer?	52
Q17. Which statement correctly identifies The 2021 Single Nodal Agency model and its supersession?	53
Q18. Which chronology card should be filed under The 2021 Single Nodal Agency model and its supersession?	53
Q19. Which option preserves the source-bounded meaning of The 2021 Single Nodal Agency model and its supersession?	54
Q20. Which statement avoids a close-option trap about The 2021 Single Nodal Agency model and its supersession?	54
Q21. Which statement correctly identifies SNA-SPARSH, just-in-time release and its dated notification trail?	55
Q22. Which chronology card should be filed under SNA-SPARSH, just-in-time release and its dated notification trail?	56
Q23. Which option preserves the source-bounded meaning of SNA-SPARSH, just-in-time release and its dated notification trail?	56
Q24. Which statement avoids a close-option trap about SNA-SPARSH, just-in-time release and its dated notification trail?	57
Q25. Which statement correctly identifies RBI e-Kuber as settlement infrastructure rather than policy?	58
Q26. Which chronology card should be filed under RBI e-Kuber as settlement infrastructure rather than policy?	58
Q27. Which option preserves the source-bounded meaning of RBI e-Kuber as settlement infrastructure rather than policy?	59
Q28. Which statement avoids a close-option trap about RBI e-Kuber as settlement infrastructure rather than policy?	59
Q29. Which statement correctly identifies The General Financial Rules, 2017 as the procedural rulebook?	60
Q30. Which chronology card should be filed under The General Financial Rules, 2017 as the procedural rulebook?	60
Q31. Which option preserves the source-bounded meaning of The General Financial Rules, 2017 as the procedural rulebook?	61
Q32. Which statement avoids a close-option trap about The General Financial Rules, 2017 as the procedural rulebook?	61
Q33. Which statement correctly identifies Leakage, exclusion and inefficiency are three different failures?	62
Q34. Which chronology card should be filed under Leakage, exclusion and inefficiency are three different failures?	63
Q35. Which option preserves the source-bounded meaning of Leakage, exclusion and inefficiency are three different failures?	63
Q36. Which statement avoids a close-option trap about Leakage, exclusion and inefficiency are three different failures?	64
Q37. Which statement correctly identifies Inclusion error and the instruments that reduce it?	64
Q38. Which chronology card should be filed under Inclusion error and the instruments that reduce it?	65
Q39. Which option preserves the source-bounded meaning of Inclusion error and the instruments that reduce it?	65

Q40. Which statement avoids a close-option trap about Inclusion error and the instruments that reduce it?	66
Q41. Which statement correctly identifies Exclusion error and the correctives that reduce it?	67
Q42. Which chronology card should be filed under Exclusion error and the correctives that reduce it?	67
Q43. Which option preserves the source-bounded meaning of Exclusion error and the correctives that reduce it?	68
Q44. Which statement avoids a close-option trap about Exclusion error and the correctives that reduce it?	68
Q45. Which statement correctly identifies Which error the design is willing to bear?	69
Q46. Which chronology card should be filed under Which error the design is willing to bear?	70
Q47. Which option preserves the source-bounded meaning of Which error the design is willing to bear?	70
Q48. Which statement avoids a close-option trap about Which error the design is willing to bear?	71
Q49. Which statement correctly identifies Why a reported savings figure is not a net welfare gain?	71
Q50. Which chronology card should be filed under Why a reported savings figure is not a net welfare gain?	72
Q51. Which option preserves the source-bounded meaning of Why a reported savings figure is not a net welfare gain?	73
Q52. Which statement avoids a close-option trap about Why a reported savings figure is not a net welfare gain?	73
Q53. Which statement correctly identifies The six-stage budget-to-beneficiary chain as a routing device?	74
Q54. Which chronology card should be filed under The six-stage budget-to-beneficiary chain as a routing device?	74
Q55. Which option preserves the source-bounded meaning of The six-stage budget-to-beneficiary chain as a routing device?	75

Public Finance and Service-Delivery Tools - Learner-v2

Complete Learning Session

Authoring-only generation: 2026-09-02. No PDF was rendered and no tracker or index was mutated.

SOURCE, PROGRESSION AND CURRENT-LINKAGE AUDIT

- **Generation date:** 2026-09-02.
- **Repository-first evidence:** the Basic owner is taught first and preserved in full; the Advanced owner is retained only in the optional final teaching block.
- **OCR evidence:** Repository Markdown was primary. The OCR-searchable official General Studies question papers held under books\mains and books\more_previous_papers were used only to confirm the printed wording of routed Mains demands. No official answer key, marking scheme, page precision or unsupported quotation was imported from them.
- **Qdrant:** not used; repository Markdown and available OCR context were sufficient.
- **PYQ integrity:** One direct General Studies Paper-II Mains demand is routed to this topic across the audited ledgers, and its stem was confirmed word for word in the locally held OCR-searchable official question paper. The audited 2018-2023 Mains ledger routes the 2022 General Studies Paper-II demand on reforming the government delivery system through the Direct Benefit Transfer Scheme and its limitations to the Advanced companion, and the Basic owner records expressly that core routing supersedes that older Advanced pointer and holds all marks-bearing content for the budget-to-beneficiary chain, so the demand is answered from the core file. No further Mains demand and no objective demand in the audited 2018-2023, 2024-2025 or 2026 ledgers is routed to this topic, so no additional demand card is manufactured and no question is invented from the locally held papers. No official answer key or marking scheme is held locally for the routed demand, so the model solution below is an authored answer route rather than an official key, and no cumulative savings figure, beneficiary count, scheme count, failure rate, coverage percentage, procurement threshold or portal statistic is recorded or inferred anywhere.
- **Live-link boundary:** One live official page was verified for this topic on 2026-09-02. The Department of Financial Services website at financialservices.gov.in was read successfully on that date and states that the Department is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to the banking, insurance and pension sectors, and that it executes initiatives and reforms concerning those sectors including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens; that statement of role is used and nothing else is inferred from it, and in particular no account, transaction, coverage or savings statistic is imported. Four further official checks were attempted on the same date and returned no usable official text, namely the Direct Benefit Transfer Mission portal, which returned only an empty modal string with no substantive content, the Public Financial Management System public entry page, which redirected to a login error, and the Department of Expenditure website, which failed at the transport level, so no content from any of them was read or used and no secondary summary has been treated as an official source. The remaining dated official elements used are those already carried by the repository owners with their status checks, namely Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023 introducing SNA-SPARSH, the Office Memorandum of 10 June 2025 extending it to thirty-seven further centrally sponsored schemes from 1 July 2025, its application from 1 November 2025 to all centrally sponsored schemes in States and Union Territories with legislatures, the comprehensive revision of the General Financial Rules in 2017, the administration of the Public Financial Management System by the Department of Expenditure, and Article 280(3)(bb) and Article 280(3)(c) for Union Finance Commission local-body grants, all as checked by the owners on 21 July 2026 and 13 August 2026. Applicability by notification is expressly distinguished from verified operational onboarding, so no claim of universal operational completion is made. No cumulative Direct Benefit Transfer savings figure is asserted, no beneficiary, scheme or transaction count is asserted, no authentication or payment-failure rate is asserted, no tracking-coverage percentage is asserted, no procurement threshold value, portal transaction volume or share of tenders is asserted, and no State fund-utilisation figure is asserted. The Aadhaar identity architecture is cross-linked to the digital public infrastructure owner and the constitutional status of local bodies to Polity rather than restated here.

- **Fact/inference discipline:** no current-affairs item, PYQ wording, figure or quotation is invented.

BASIC LEARNING SESSION

Refreshed teaching navigation

Distinct embedded teaching-navigation image. The separate continuous Cārvāka-style flowchart package remains an independent at-a-glance artifact.

SESSION 1 - FOUNDATION - THE BUDGET-TO-BENEFICIARY CHAIN THIS TOPIC OWNS

DEFINITION / WHAT THIS IS CALLED

Plain-language definition: FOUNDATION - The budget-to-beneficiary chain this topic owns comprises FOUNDATION, The budget-to-beneficiary chain this topic owns and Evidence chain as its core connected dimensions.

Technical definition: Evidence chain: The budget-to-beneficiary chain this owner holds Qualified use: Set the correct scope in the first sentence of any financial-flow demand.

ANSWER-GRABBING OPENING - WRITE/ADAPT IN THE EXAM

This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions.

MUST-WRITE KEYWORDS

- FOUNDATION
- The budget-to-beneficiary chain this topic owns
- Evidence chain
- Qualified use

- This
- Jan Dhan

How to use them: Frame the answer through FOUNDATION; define The budget-to-beneficiary chain this topic owns, connect Evidence chain with Qualified use to explain the mechanism, and use This for the decisive comparison or qualification.

VISUAL FIRST

THE BUDGET-TO-BENEFICIARY CHAIN THIS TOPIC OWNS

01. The budget-to-beneficiary chain this owner holds

BOUNDARY -> Aadhaar identity design and the constitutional status of local bodies belong to other owners.

This topic-specific rail fixes the evidence sequence and its exam boundary before analysis.

CORE EXPLANATION

This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions.

NAMED EVIDENCE AND MECHANISM

- This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions.

EXAMINER CAUTION

- Aadhaar identity design and the constitutional status of local bodies belong to other owners.

EXAM LINK

- **Prelims:** Retain the exact statute, section, institution, official category, dated edition or scope rule attached to The budget-to-beneficiary chain this topic owns.
- **Mains:** Set the correct scope in the first sentence of any financial-flow demand.

MINI RECAP

- **Evidence chain:** The budget-to-beneficiary chain this owner holds
- **Qualified use:** Set the correct scope in the first sentence of any financial-flow demand.

|
v

ANSWER-GRABBING FORMULATION: This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions.

SESSION 2 - FOUNDATION - THE IDENTITY AND PAYMENTS FOUNDATION

DEFINITION / WHAT THIS IS CALLED

Plain-language definition: The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it.

Technical definition: Evidence chain: The identity and payments foundation named JAM Qualified use: Anchor the precondition without importing any unverified statistic.

ANSWER-GRABBING OPENING - WRITE/ADAPT IN THE EXAM

Evidence chain: The identity and payments foundation named JAM Qualified use: Anchor the precondition without importing any unverified statistic.

MUST-WRITE KEYWORDS

- FOUNDATION
- The identity
- payments foundation
- Evidence chain
- Qualified use
- The JAM trinity

How to use them: Frame the answer through FOUNDATION; define The identity, connect payments foundation with Evidence chain to explain the mechanism, and use Qualified use for the decisive comparison or qualification.

VISUAL FIRST

THE IDENTITY AND PAYMENTS FOUNDATION

01. The identity and payments foundation named JAM

BOUNDARY -> The live official page is used only for the Department's stated role and nothing further.

This topic-specific rail fixes the evidence sequence and its exam boundary before analysis.

CORE EXPLANATION

The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it.

NAMED EVIDENCE AND MECHANISM

- The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it.

EXAMINER CAUTION

- The live official page is used only for the Department's stated role and nothing further.

EXAM LINK

- **Prelims:** Retain the exact statute, section, institution, official category, dated edition or scope rule attached to The identity and payments foundation.
- **Mains:** Anchor the precondition without importing any unverified statistic.

MINI RECAP

- **Evidence chain:** The identity and payments foundation named JAM
- **Qualified use:** Anchor the precondition without importing any unverified statistic.

CLOSING RECALL FLOW - FOUNDATION - THE IDENTITY AND PAYMENTS FOUNDATION

START / CONCEPT: FOUNDATION - The identity and payments foundation

|
v

EXACT TERMS: FOUNDATION · The identity · payments foundation · Evidence chain · Qualified use · The JAM trinity

|
v

MECHANISM / ARGUMENT: The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it.

|
v

ANSWER-GRABBING FORMULATION: Evidence chain: The identity and payments foundation named JAM Qualified use: Anchor the precondition without importing any unverified statistic.

SESSION 3 - FOUNDATION - WHAT AUTHENTICATED TRANSFER ACTUALLY REFORMED

DEFINITION / WHAT THIS IS CALLED

Plain-language definition: Evidence chain: Direct Benefit Transfer is a payments reform broader than cash Qualified use: Open a benefit-transfer answer with the route that changed rather than with a definition.

Technical definition: Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed.

ANSWER-GRABBING OPENING - WRITE/ADAPT IN THE EXAM

Evidence chain: Direct Benefit Transfer is a payments reform broader than cash Qualified use: Open a benefit-transfer answer with the route that changed rather than with a definition.

MUST-WRITE KEYWORDS

- FOUNDATION
- What authenticated transfer actually reformed
- Evidence chain
- Qualified use
- Direct Benefit Transfer
- Cash transfer

How to use them: Frame the answer through FOUNDATION; define What authenticated transfer actually reformed, connect Evidence chain with Qualified use to explain the mechanism, and use Direct Benefit Transfer for the decisive comparison or qualification.

VISUAL FIRST

WHAT AUTHENTICATED TRANSFER ACTUALLY REFORMED

01. Direct Benefit Transfer is a payments reform broader than cash

BOUNDARY -> Cash transfer is one category of the instrument and not the whole of it.

This topic-specific rail fixes the evidence sequence and its exam boundary before analysis.

CORE EXPLANATION

Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed.

NAMED EVIDENCE AND MECHANISM

- Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed.

EXAMINER CAUTION

- Cash transfer is one category of the instrument and not the whole of it.

EXAM LINK

- **Prelims:** Retain the exact statute, section, institution, official category, dated edition or scope rule attached to What authenticated transfer actually reformed.
- **Mains:** Open a benefit-transfer answer with the route that changed rather than with a definition.

MINI RECAP

- **Evidence chain:** Direct Benefit Transfer is a payments reform broader than cash
- **Qualified use:** Open a benefit-transfer answer with the route that changed rather than with a definition.

CLOSING RECALL FLOW - FOUNDATION - WHAT AUTHENTICATED TRANSFER ACTUALLY REFORMED

START / CONCEPT: FOUNDATION - What authenticated transfer actually reformed

|
v

EXACT TERMS: FOUNDATION • What authenticated transfer actually reformed • Evidence chain •
Qualified use • Direct Benefit Transfer • Cash transfer

|
v

MECHANISM / ARGUMENT: Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed.

|
v

ANSWER-GRABBING FORMULATION: Evidence chain: Direct Benefit Transfer is a payments reform broader than cash
Qualified use: Open a benefit-transfer answer with the route that changed rather than with a definition.

SESSION 4 - CORE - THE FUND-TRACKING LAYER AND ITS OWN LEAKAGE RISK

DEFINITION / WHAT THIS IS CALLED

Plain-language definition: The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level.

Technical definition: Evidence chain: The Public Financial Management System and the agency layer Qualified use: Separate agency-level diversion from beneficiary-level leakage in one sentence.

ANSWER-GRABBING OPENING - WRITE/ADAPT IN THE EXAM

The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level.

MUST-WRITE KEYWORDS

- The fund-tracking layer
- its own leakage risk
- Evidence chain
- Qualified use
- The Public Financial Management System
- Department

How to use them: Frame the answer through The fund-tracking layer; define its own leakage risk, connect Evidence chain with Qualified use to explain the mechanism, and use The Public Financial Management System for the decisive comparison or qualification.

VISUAL FIRST

THE FUND-TRACKING LAYER AND ITS OWN LEAKAGE RISK

01. The Public Financial Management System and the agency layer

BOUNDARY -> Not every internal utilisation trail is public at beneficiary level.

This topic-specific rail fixes the evidence sequence and its exam boundary before analysis.

CORE EXPLANATION

The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level.

NAMED EVIDENCE AND MECHANISM

- The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level.

EXAMINER CAUTION

|

v

ANSWER-GRABBING FORMULATION: The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level.

SESSION 5 - CORE - FROM THE SINGLE NODAL AGENCY MODEL TO SNA-SPARSH

DEFINITION / WHAT THIS IS CALLED

Plain-language definition: Evidence chain: The 2021 Single Nodal Agency model and its supersession - SNA-SPARSH, just-in-time release and its dated notification trail
Qualified use: Name the architecture and its current stage instead of writing that funds are tracked.

Technical definition: The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded.

ANSWER-GRABBING OPENING - WRITE/ADAPT IN THE EXAM

Evidence chain: The 2021 Single Nodal Agency model and its supersession - SNA-SPARSH, just-in-time release and its dated notification trail
Qualified use: Name the architecture and its current stage instead of writing that funds are tracked.

MUST-WRITE KEYWORDS

- From the Single Nodal Agency model to SNA-SPARSH
- Evidence chain

- **Qualified use**
- **The Single Nodal Agency**
- **Finance Commission**
- **SNA-SPARSH**

How to use them: Frame the answer through From the Single Nodal Agency model to SNA-SPARSH; define Evidence chain, connect Qualified use with The Single Nodal Agency to explain the mechanism, and use Finance Commission for the decisive comparison or qualification.

FROM THE SINGLE NODAL AGENCY MODEL TO SNA-SPARSH

01. The 2021 Single Nodal Agency model and its supersession

|
v

02. SNA-SPARSH, just-in-time release and its dated notification trail

BOUNDARY -> Applicability by notification is not verified operational onboarding for every scheme and State.

This topic-specific rail fixes the evidence sequence and its exam boundary before analysis.

CORE EXPLANATION

The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all.

NAMED EVIDENCE AND MECHANISM

- The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded.
- SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all.

EXAMINER CAUTION

- Applicability by notification is not verified operational onboarding for every scheme and State.

EXAM LINK

- **Prelims:** Retain the exact statute, section, institution, official category, dated edition or scope rule attached to From the Single Nodal Agency model to SNA-SPARSH.
- **Mains:** Name the architecture and its current stage instead of writing that funds are tracked.

MINI RECAP

v

02. The General Financial Rules, 2017 as the procedural rulebook

BOUNDARY -> Settlement infrastructure is not a reform, and the rulebook must always carry its year.

This topic-specific rail fixes the evidence sequence and its exam boundary before analysis.

CORE EXPLANATION

RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named.

NAMED EVIDENCE AND MECHANISM

- RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised.

SESSION 8 - CORE - INCLUSION ERROR AND EXCLUSION ERROR

DEFINITION / WHAT THIS IS CALLED

Plain-language definition: Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix.

Technical definition: Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove.

ANSWER-GRABBING OPENING - WRITE/ADAPT IN THE EXAM

Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix.

SESSION 11 - CORE - LOCATING A DEMAND ON THE SIX-STAGE CHAIN

DEFINITION / WHAT THIS IS CALLED

Plain-language definition: Answering a stage-four demand with stage-five material is a visible routing error.

Technical definition: The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately.

ANSWER-GRABBING OPENING - WRITE/ADAPT IN THE EXAM

Answering a stage-four demand with stage-five material is a visible routing error.

MUST-WRITE KEYWORDS

- Locating a demand on the six-stage chain
- Evidence chain
- Qualified use
- ing a stage-four demand with stage-five material
- ing
- Qualified

How to use them: Frame the answer through Locating a demand on the six-stage chain; define Evidence chain, connect Qualified use with ing a stage-four demand with stage-five material to explain the mechanism, and use ing for the decisive comparison or qualification.

VISUAL FIRST

LOCATING A DEMAND ON THE SIX-STAGE CHAIN

01. The six-stage budget-to-beneficiary chain as a routing device

BOUNDARY -> Answering a stage-four demand with stage-five material is a visible routing error.

This topic-specific rail fixes the evidence sequence and its exam boundary before analysis.

CORE EXPLANATION

The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately.

NAMED EVIDENCE AND MECHANISM

- The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately.

EXAMINER CAUTION

- Answering a stage-four demand with stage-five material is a visible routing error.

EXAM LINK

- **Prelims:** Retain the exact statute, section, institution, official category, dated edition or scope rule attached to Locating a demand on the six-stage chain.
- **Mains:** Route any novel financial instrument through a stage-by-stage diagnosis.

MINI RECAP

- **Evidence chain:** The six-stage budget-to-beneficiary chain as a routing device
- **Qualified use:** Route any novel financial instrument through a stage-by-stage diagnosis.

CLOSING RECALL FLOW - CORE - LOCATING A DEMAND ON THE SIX-STAGE CHAIN

|

v

ANSWER-GRABBING FORMULATION: Answering a stage-four demand with stage-five material is a visible routing error.

SESSION 12 - CORE - PROCUREMENT FAILURE BEYOND CORRUPTION

DEFINITION / WHAT THIS IS CALLED

Plain-language definition: The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default.

Technical definition: Evidence chain: Procurement failure points beyond corruption - Procurement integrity instruments and the disclosure discipline Qualified use: Replace an anti-corruption reflex with a value-for-money analysis.

ANSWER-GRABBING OPENING - WRITE/ADAPT IN THE EXAM

Evidence chain: Procurement failure points beyond corruption - Procurement integrity instruments and the disclosure discipline Qualified use: Replace an anti-corruption reflex with a value-for-money analysis.

MUST-WRITE KEYWORDS

- Procurement failure beyond corruption
- Evidence chain
- Qualified use
- Procurement
- Qualified
- Replace

How to use them: Frame the answer through Procurement failure beyond corruption; define Evidence chain, connect Qualified use with Procurement to explain the mechanism, and use Qualified for the decisive comparison or qualification.

PROCUREMENT FAILURE BEYOND CORRUPTION

01. Procurement failure points beyond corruption

|

v

02. Procurement integrity instruments and the disclosure discipline

BOUNDARY -> Tighter rules lengthen timelines and deter capable suppliers from bidding.

This topic-specific rail fixes the evidence sequence and its exam boundary before analysis.

CORE EXPLANATION

Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default.

SESSION 14 - CORE SYNTHESIS - JUST-IN-TIME RELEASE AND LOCAL-BODY FINANCE

DEFINITION / WHAT THIS IS CALLED

Plain-language definition: Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied.

Technical definition: Evidence chain: Just-in-time release as an intergovernmental trade-off with uneven incidence - Local-body finance and the three-source test Qualified use: Carry the fiscal-federalism trade-off into the local-finance layer of the answer.

ANSWER-GRABBING OPENING - WRITE/ADAPT IN THE EXAM

Evidence chain: Just-in-time release as an intergovernmental trade-off with uneven incidence - Local-body finance and the three-source test Qualified use: Carry the fiscal-federalism trade-off into the local-finance layer of the answer.

MUST-WRITE KEYWORDS

- **CORE SYNTHESIS**
- **Just-in-time release**
- **local-body finance**

- Evidence chain
- Qualified use
- Article 280

How to use them: Frame the answer through CORE SYNTHESIS; define Just-in-time release, connect local-body finance with Evidence chain to explain the mechanism, and use Qualified use for the decisive comparison or qualification.

VISUAL FIRST

JUST-IN-TIME RELEASE AND LOCAL-BODY FINANCE

01. Just-in-time release as an intergovernmental trade-off with uneven incidence

|
v

02. Local-body finance and the three-source test

BOUNDARY -> Union efficiency is a real cost at the State level and at the local tier.

This topic-specific rail fixes the evidence sequence and its exam boundary before analysis.

CORE EXPLANATION

Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure.

NAMED EVIDENCE AND MECHANISM

- Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied.

SESSION 15 - CORE SYNTHESIS - OUTCOME MEASUREMENT, DATA QUALITY AND OWNERSHIP

DEFINITION / WHAT THIS IS CALLED

Plain-language definition: Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint.

Technical definition: Evidence chain: Outcome measurement, data quality and honest question ownership Qualified use: Close a twenty-mark answer at the outcome stage with an explicit data boundary.

ANSWER-GRABBING OPENING - WRITE/ADAPT IN THE EXAM

Evidence chain: Outcome measurement, data quality and honest question ownership Qualified use: Close a twenty-mark answer at the outcome stage with an explicit data boundary.

MUST-WRITE KEYWORDS

- **CORE SYNTHESIS**
- **Outcome measurement**
- **data quality**
- **ownership**

- Evidence chain
- Qualified use

How to use them: Frame the answer through CORE SYNTHESIS; define Outcome measurement, connect data quality with ownership to explain the mechanism, and use Evidence chain for the decisive comparison or qualification.

VISUAL FIRST

OUTCOME MEASUREMENT, DATA QUALITY AND OWNERSHIP

01. Outcome measurement, data quality and honest question ownership

BOUNDARY -> Coverage is scheme-specific, output reporting still dominates and the routing is stated.

This topic-specific rail fixes the evidence sequence and its exam boundary before analysis.

CORE EXPLANATION

Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package.

NAMED EVIDENCE AND MECHANISM

- Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package.

EXAMINER CAUTION

- Coverage is scheme-specific, output reporting still dominates and the routing is stated.

EXAM LINK

- **Prelims:** Retain the exact statute, section, institution, official category, dated edition or scope rule attached to Outcome measurement, data quality and ownership.
- **Mains:** Close a twenty-mark answer at the outcome stage with an explicit data boundary.

MINI RECAP

- **Evidence chain:** Outcome measurement, data quality and honest question ownership
- **Qualified use:** Close a twenty-mark answer at the outcome stage with an explicit data boundary.

COMPLETE BASIC OWNER EVIDENCE BANK

Subject: Governance | **Tier:** Must-Do (foundation) | **GS Paper:** GS-II, with GS-III public-finance links. **Core area:** DBT, the JAM trinity, PFMS, Single Nodal Agency (SNA) and the General Financial Rules, 2017 as financial-flow tools for service delivery. **Grounded in:** DBT Mission (Ministry of Finance/Cabinet Secretariat); Public Financial Management System (PFMS), Department of Expenditure; General Financial Rules, 2017; official UPSC GS-II syllabus ("government policies and interventions"). **FACT:** = source-grounded | **ANALYSIS:** = analytical inference | **CURRENT:** = current anchor. *Companion:* advanced/13_Public-Finance-and-Service-Delivery-Tools.md.

1. Visual foundation

Core proposition: FACT: India's financial-flow tools form a layered stack - JAM, DBT, PFMS and the evolving SNA/SNA-SPARSH CSS release architecture - within GFR 2017. Each solves a different problem and must be evaluated for payment failure, exclusion, state integration and reconciliation, not only leakage reduction.

2. Essential definitions

Concept	Exam-ready meaning
FACT: JAM Trinity	The combination of Jan Dhan (universal bank-account access), Aadhaar (unique identity) and Mobile connectivity that together provide the technical foundation for targeted, verifiable digital benefit transfer at population scale.
FACT: Direct Benefit Transfer (DBT)	A delivery reform covering cash transfers to individual accounts, in-kind benefits delivered through authenticated systems, and certain transfers to service enablers. DBT is therefore broader than bank-credit alone, though cash DBT is its most visible form.
FACT: PFMS (Public Financial Management System)	A Department of Expenditure system that tracks the flow of government funds - from budgetary sanction through release to implementing agencies to actual expenditure/utilisation - providing real-time visibility into fund use across schemes.
FACT: SNA model and SNA-SPARSH	The 2021 SNA model used a designated agency/account structure for each CSS. The later SNA-SPARSH architecture integrates PFMS, State IFMIS and RBI e-Kuber for just-in-time release. Do not describe the older bank-account model as the whole current architecture.
FACT: General Financial Rules (GFR), 2017	The Union government's consolidated rulebook governing financial management, budgeting, procurement and expenditure control across ministries/departments - the procedural backbone within which DBT, PFMS and SNA operate.

3. How these tools function together (mechanism)

- Identity and access foundation:** JAM ensures a beneficiary has a bank account, verifiable identity and a channel (mobile) for transaction notification/tracking - without this foundation, direct transfer to individuals at scale would not be feasible.
- Targeted transfer:** DBT uses this foundation to transfer benefits directly, using

Aadhaar-based or bank-based de-duplication to eliminate fake and duplicate beneficiaries that a manual, intermediary-routed system could not easily detect.

3. **End-to-end tracking:** PFMS follows the fund from the point of budgetary release through implementing agencies down to actual utilisation, allowing real-time identification of idle/unspent balances and expenditure patterns across schemes.

4. **Release discipline:** the SNA model improved visibility over balances; SNA-SPARSH moves further toward just-in-time release through PFMS-State IFMIS-RBI e-Kuber integration.

5. **Procedural governance:** all these tools operate within the GFR, 2017's overarching rules on sanctioning, procurement and expenditure control, which set the baseline procedural requirements DBT/PFMS/SNA are designed to make more transparent and trackable.

4. Institutions and tools

- FACT: **DBT Mission** - coordinates Direct Benefit Transfer policy and implementation across ministries, functioning under the Cabinet Secretariat/Ministry of Finance oversight structure.
- FACT: **PFMS (Department of Expenditure, Ministry of Finance)** - the central fund-tracking IT system used across a very large number of central and centrally sponsored schemes.
- FACT: **SNA-SPARSH** - Department of Expenditure's current just-in-time CSS mechanism. Official 2025 OMs scheduled expansion to all CSS in States/UTs with legislatures from 1 November 2025; actual onboarding/reconciliation should still be verified operationally.
- FACT: **General Financial Rules, 2017** - the consolidated financial-management rulebook, periodically updated, most recently comprehensively revised in 2017.

5. Indian applications and examples

- ANALYSIS: DBT-enabled de-duplication of ration cards and job cards (MGNREGA, PDS) is commonly cited as reducing leakage from "ghost" or ineligible beneficiaries. No fixed cumulative savings figure is asserted here, since the DBT Mission/PFMS dashboard's reported savings figure rises continuously as more schemes and years are covered; the durable, exam-safe proposition is that DBT's savings arise specifically from removing fake, duplicate and ineligible beneficiary entries, not from a one-time reported total.
- ANALYSIS: SNA-SPARSH applied to a CSS illustrates just-in-time release through integrated financial systems, while also exposing implementation risks where State IFMIS/PFMS data or contribution reconciliation is delayed.
- ANALYSIS: PFMS provides sanction/payment and authorised management reporting, including "Know Your Payment"; not every internal utilisation trail is necessarily public at beneficiary level.

6. Must-Know Facts for Prelims

- FACT: JAM stands for Jan Dhan, Aadhaar and Mobile - the technical foundation for India's digital financial-inclusion and benefit-transfer architecture.
- FACT: PFMS is administered by the Department of Expenditure, Ministry of Finance.
- FACT: SNA and SNA-SPARSH are successive but distinct fund-flow designs; SNA-SPARSH uses PFMS-State IFMIS-RBI e-Kuber integration for just-in-time release.
- FACT: The General Financial Rules were comprehensively revised in 2017 and govern Union government financial management and procurement.

7. UPSC traps

- WRONG: DBT eliminates all forms of leakage in welfare delivery. -> DBT primarily addresses identity-based leakage (fake/duplicate/ghost beneficiaries); it does not by itself resolve targeting errors (genuine beneficiaries wrongly excluded) or quality/adequacy issues in the underlying scheme design.
- WRONG: PFMS and DBT are the same system. -> DBT is the benefit-transfer mechanism to

individual beneficiaries; PFMS is the broader fund-flow tracking system covering government-to-agency and government-to-implementer transfers across schemes, not only individual beneficiary transfers.

- **WRONG:** The Single Nodal Agency model applies uniformly to all government schemes. -> It applies specifically to centrally sponsored schemes' state-level fund flow, not to central-sector schemes or all government expenditure generally.

- **WRONG:** Any specific cumulative DBT savings figure is a fixed, permanently citable number. -> Such figures rise continuously as the DBT Mission/PFMS dashboard's reporting period extends; the durable proposition is that DBT reduces leakage from fake, duplicate and ineligible beneficiaries, not any single cumulative rupee total.

8. CURRENT: Current anchor

- **CURRENT: Status re-verified 13 August 2026:** SNA-SPARSH is the current official just-in-time CSS architecture, introduced by Department of Expenditure **OM No. 1(27)/PFMS/2020 dated 13 July 2023**. A **10 June 2025 OM** extended it to 37 further CSSs from **1 July 2025**, and from **1 November 2025** it applies to all CSSs in States/UTs with legislatures. **ANALYSIS:** Applicability by notification is not the same as verified operational onboarding for every scheme and State - verify before asserting universal operational completion. GFR 2017 remains the consolidated rulebook, subject to amendments; cite the year.

9. PYQ application

- **ANALYSIS:** No GS-II Mains question in the audited 2024-2025 papers names DBT/PFMS/SNA/GFR directly, but this file's financial-flow framework is directly relevant background for any question on implementation efficiency, leakage reduction or service-delivery effectiveness (see 02), and for GS-III-linked public-finance/subsidy-reform questions that intersect with GS-II governance-tool knowledge.
- **ANALYSIS:** Use the JAM-DBT-PFMS-SNA-GFR layered framework as the standard structuring device whenever a question asks how India has improved financial-flow transparency or reduced welfare-scheme leakage.

10. Mains angles

- **ANALYSIS:** Always distinguish leakage reduction (DBT's core strength) from targeting-error correction (a separate, harder problem DBT does not automatically solve) in any evaluative answer.
- **ANALYSIS:** Cite PFMS and SNA together as the fund-flow transparency and discipline layer, distinct from DBT's beneficiary-transfer layer.
- **ANALYSIS:** Cross-link to 06 for the Aadhaar/DPI identity foundation underlying JAM, avoiding duplication of that content here.

Answer thesis: India's DBT-PFMS-SNA financial-flow architecture, built on the JAM trinity and operating within the GFR's procedural framework, has measurably reduced identity-based leakage in welfare delivery, but it addresses leakage, not targeting accuracy or scheme design quality, and its reported savings figures must always be cited with their reporting date given their dynamic, frequently updated nature.

11. Probable questions

- **ANALYSIS: Prelims:** What does the JAM trinity stand for, and which system tracks government fund flow from sanction to utilisation?
- **ANALYSIS: Mains (10 marks):** Distinguish the roles of DBT, PFMS and the Single Nodal Agency model in India's public financial management architecture.
- **ANALYSIS: Mains (15 marks):** "Direct Benefit Transfer addresses leakage, not targeting accuracy." Critically examine this statement with reference to India's welfare-delivery reforms.

12. Study links

- **FACT:** Advanced companion: `advanced/13_Public-Finance-and-Service-Delivery-Tools.md`.
- **FACT:** `06_Digital-Public-Infrastructure-and-Data-Governance.md` - the Aadhaar/JAM identity

foundation.

- FACT: 02_Government-Policy-Design-and-Implementation.md - the implementation-gap framework these tools are designed to address.
- FACT: 15_Monitoring-Evaluation-and-Outcomes.md - using fund-flow data for outcome evaluation.

13. Answer architecture (10/15/20-mark support)

Scope. All marks-bearing content for the *budget-to-beneficiary* chain - DBT, PFMS, SNA/SNA-SPARSH, GFR and procurement - including the DBT demand the 2018-2023 ledger routed to advanced/13, is held **in this file**. advanced/13 is optional enrichment only.

13.0 Direct Mains demand owned by this Core file

ANALYSIS: **Core routing supersedes the older Advanced pointer.**

2022 GS-II Q8 - Direct Benefit Transfer as a reform and its limitations (10 marks, "comment"). Executable route:

1. State what DBT actually reformed, precisely: it changed the **route** of a benefit - from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary - and thereby attacked **identity-based leakage**.
2. The mechanism in one sentence: population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed.
3. Scope precision that most answers miss: DBT is **not only cash**. It covers cash transfers to individuals, **in-kind** benefits delivered through authenticated systems, and certain transfers to service enablers. Treating DBT as a synonym for cash transfer is a scope error.
4. Limitations, in the correct analytical order:
(i) **it addresses leakage, not targeting** - a wrong or outdated beneficiary list transfers money accurately to the wrong people; (ii) **exclusion error** - authentication failure, seeding errors, dormant or frozen accounts, and name mismatches deny genuine beneficiaries, and the failure falls on the least-equipped; (iii) **last-mile cash access** - a credited account is not money in hand where banking correspondents, connectivity or distance intervene; (iv) **cash is not a substitute for provision** - where a market does not exist or prices are volatile, transferring cash instead of the good shifts price risk to the poorest; (v) **grievance** - payment-failure redress is weak and often has no named addressee; (vi) **the savings claim** - reported "savings" typically measure the value of **removed ineligible or duplicate entries**, which is a different and larger number than a net welfare gain, since it does not net out exclusion cost.
5. Balance: DBT genuinely reduced intermediation, improved timeliness for most recipients, and created an auditable payment trail - concede this or the comment is one-sided.
6. Correctives: offline/assisted authentication fallback; exception-handling with a named officer; periodic beneficiary-list revision (a targeting fix, not a payments fix); payment grievance route with a timeline; and monitoring **exclusion** as a reported metric alongside savings.
7. Verdict: DBT is a successful **payments** reform being asked to carry the weight of a **targeting and provision** reform it was never designed to deliver. **WRONG:** Do not cite a cumulative DBT savings figure, beneficiary count, scheme count or authentication-failure rate.

13.1 Demand map

Stem pattern	What is being tested	Opening move
"DBT and leakage"	Leakage vs targeting	Separate the two in sentence one; they need different fixes
"Fund flow / just-in-time"	Institutional precision	Name the architecture and its current stage, not "PFMS tracks funds"
"Public financial management and delivery"	Chain reasoning	Trace budget -> release -> agency -> beneficiary
"Procurement / GFR"	Rule vs outcome	Rules control process; outcomes need capacity and market design
"Outcome budgeting"	Cross-topic link	Financial input vs outcome measure (see 15)
Novel instrument (a new transfer, voucher, cash-for-service scheme)	Transferability	Apply the six-stage budget-to-beneficiary chain (§13.5) and the E1/E2 test

13.2 Qualified theses

- **T1 (scope):** "DBT is a payments reform, not a welfare reform: it fixes who receives the money and when, and leaves untouched who is on the list and whether the benefit is the right one."
- **T2 (error trade-off):** "Every tightening of verification reduces inclusion error and increases exclusion error; for subsistence entitlements the governance question is not how to minimise total error but which error the state is willing to bear."
- **T3 (fiscal federalism):** "Just-in-time release genuinely eliminates idle float and genuinely constrains State cash planning - efficiency at the Union level is a real cost at the State level, and the reform is defensible only if that cost is acknowledged."
- **T4 (rules vs capacity):** "GFR and procurement rules discipline process and cannot produce value: the binding constraints on public procurement outcomes are specification quality, market competition and contract management, none of which a rulebook supplies."

13.3 Mark-scaled structure

10 marks - what the instrument reforms; two limitations with mechanisms; two mapped correctives; verdict.

15 marks - thesis; the tool stack with each tool's distinct problem (§13.4); 4-6 evidence units; the E1/E2 analysis; the federal trade-off; graded verdict.

20 marks - thesis with criteria; the six-stage budget-to-beneficiary chain traced end-to-end (§13.5); leakage vs exclusion vs privacy vs federal capacity as **four separate** evaluative axes; procurement and outcome budgeting as the front and back ends of the same chain; verdict with reversal condition.

13.4 Evidence bank - the tool stack, each solving a different problem

Tool	The specific problem it solves	Mechanism	Limitation / caution
FACT: JAM - Jan Dhan · Aadhaar · Mobile	The precondition: a verifiable person with an account and a notification channel	Enables individual-level transfer at population scale	Account existence ≠ usable account; dormancy, joint control and distance persist
FACT: DBT	Identity-based leakage - fake, duplicate and ineligible entries	Authenticated transfer to a verified beneficiary; covers cash, in-kind and service-enabler categories	Does not correct targeting error or scheme design; creates a distinct exclusion risk
FACT: PFMS (Department of Expenditure)	Diversion and idle balances at the agency/intermediary level	End-to-end tracking from sanction through release to utilisation; sanction/payment and authorised management reporting, including "Know Your Payment"	ANALYSIS: Not every internal utilisation trail is public at beneficiary level; a different leakage risk from DBT's
FACT: SNA model (2021)	Visibility over CSS balances held in State accounts	Designated agency/account structure per scheme	Superseded in architecture - WRONG: do not describe the bank-account model as the current whole
FACT: SNA-SPARSH	Float and idle parking in the CSS release chain	Just-in-time release integrating PFMS + State IFMIS + RBI e-Kuber ; Centre and State shares released together against actual expenditure claims rather than parked in advance	CURRENT: Introduced by Department of Expenditure OM No. 1(27)/PFMS/2020 dated 13 July 2023 ; a 10 June 2025 OM extended 37 more CSSs from 1 July 2025 , and from 1 November 2025 all CSSs in States/UTs with legislatures. ANALYSIS: Verify actual scheme/State onboarding before claiming universal operational completion
FACT: RBI e-Kuber	Settlement without commercial-bank float	Transfers between the Centre's and the State's RBI accounts	An infrastructure component, not a policy
FACT: GFR, 2017	Procedural discipline over sanction, procurement and expenditure	The consolidated Union rulebook within which the above operate	Rules, not outcomes; periodically amended - cite the year
FACT: Outcome budgeting / OOMF	Linking outlay to intended outcomes (see 15)	Forces outcome indicators alongside financial allocation	Coverage is scheme-specific; output reporting still dominates

13.5 The six-stage budget-to-beneficiary chain

1 BUDGET	appropriation, scheme approval, outlay	-> failure: unrealistic outlay
2 RELEASE	Union -> State / implementing agency (SNA-SPARSH just-in-time; e-Kuber)	-> failure: delay, float, parking
3 AGENCY	agency receives, incurs, reports (PFMS)	-> failure: diversion, idle balance
4 PROCUREMENT	goods/works/services bought under GFR and applicable procurement rules	-> failure: specification, cartel, single-bid, contract management
5 BENEFICIARY	transfer or service delivered (DBT/JAM)	-> failure: E2 exclusion, last-mile cash access
6 OUTCOME	did the money change anything? (OOMF/DMEQ)	-> failure: outputs counted only

ANALYSIS: Use this to locate a question. "Leakage" questions are stages 3-5; "delay" questions are stage 2; "value for money" questions are stage 4; "did it work" questions are stage 6. Answering a stage-4 question with DBT material is a routing error the examiner will see.

13.6 The error framework (E1/E2) - the analytical core of any targeting answer

	Definition	Cause	Instrument that reduces it	Cost of reducing it
E1 - inclusion error	Ineligible person receives the benefit	Fake/duplicate entries; outdated lists; false declaration	Authentication, de-duplication, verification	Raises E2
E2 - exclusion error	Eligible person does not receive it	Authentication failure; seeding/name mismatch; missing documents; distance; dormant account; list not updated	Assisted/offline fallback; exception handling; periodic list revision; grievance with a timeline	Raises E1 and administrative cost

ANALYSIS: **The examinable judgment:** E1 is a fiscal cost to the state; E2 is a subsistence cost to a person. For food, pension and wage entitlements the asymmetry justifies tolerating some E1 to protect against E2 - and a governance answer should say which error the design is optimising against, and why. ANALYSIS: Also distinguish **leakage** (benefit diverted) from **exclusion** (benefit never reaching an eligible person) from **inefficiency** (benefit delivered at excessive cost) - three separate problems routinely merged into one word.

13.7 Procurement: what a governance answer must contain

- **Framework:** procurement by Union ministries operates within the **GFR, 2017** and the applicable procurement rules and manuals; the objective is value for money with transparency, competition, fairness and non-discrimination.
- **Failure points beyond corruption:** over-specified or vendor-tailored specifications; single-bid and limited-competition outcomes; **lowest-cost selection for quality-dependent services;** weak contract management after award; and inadequate capacity to evaluate technically complex bids.
- **Integrity instruments:** conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award, and audit of the award decision - and, on the 2026 Prelims Q53 pattern, the discipline that **confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority** (see 08 §13.0(c)).
- **Trade-off:** tighter procurement rules raise process integrity and lengthen timelines and deter capable suppliers from bidding - an honest answer names both. **WRONG:** Do not assert a procurement threshold value, a portal's transaction volume, or a percentage of tenders on any platform.

13.8 Counter-argument, trade-off and stakeholder variation

Trade-offs. *Efficiency vs State fiscal autonomy* - just-in-time release removes float and constrains State cash planning; the Union gains visibility and the State loses buffer. *Verification vs access* - §13.6. *Cash vs kind* - cash respects choice and shifts price risk to the recipient; kind guarantees the good and requires a supply chain. *Rules vs discretion* in procurement - predictability against responsiveness. *Digital trail vs privacy* - an auditable payment trail is also a behavioural record (see 06). *Centralised systems vs resilience* - one payment rail failing stops everything that depends on it.

Stakeholders. *Beneficiary* - bears authentication failure, travel and account-access cost. *Banking correspondent* - the actual last mile in much of rural India, with commission incentives. *Implementing agency* - faces reconciliation and reporting load under just-in-time release. *State finance department* - loses cash-flow buffer and gains reporting obligations. *Union ministry* - gains visibility and real-time control. *Supplier/contractor* - responds to procurement design; small suppliers are most affected by compliance burden. *Auditor* - can now see the trail, and the trail is only as good as the classification behind it.

13.8A Local-government finance

- **FACT:** Art **280(3)(bb)** directs the Union Finance Commission to recommend measures augmenting State Consolidated Funds for Panchayat resources; Art **280(3)(c)** does the same for Municipalities, based on State Finance Commission recommendations.
- **Three-source test:** local own revenue + State devolution/SFC + Union FC grants. A local body dependent on only the third has spending capacity without fiscal autonomy.

- **Tied vs untied:** tied grants protect national service priorities; untied resources

preserve local choice. A credible answer states the trade-off.

- **Accountability condition:** audited accounts, predictable release, transparent formula and public disclosure must accompany transfer.

- Cross-link 12 for property tax, municipal bonds, the 3Fs and parastatal control.

13.9 Verdict scaffolds

- **DBT stem:** "DBT succeeded precisely at what it was designed to do and is routinely evaluated against what it was not: it fixed the payment route, not the beneficiary list, and not the question of whether cash was the right benefit."

- **Fund-flow stem:** "Just-in-time release is a genuine fiscal-efficiency gain purchased with State cash-planning flexibility and a heavy reconciliation load - a bargain worth making, provided the integration works."

- **Leakage stem:** "Leakage, exclusion and inefficiency are three different failures with three different instruments; treating them as one is why 'plug the leakages' recommendations rarely change outcomes."

- **Novel-instrument stem:** run the six stages, then ask which error the design tolerates and who bears it.

13.10 Factual and current-status controls

- **FACT:** Safe: JAM as Jan Dhan + Aadhaar + Mobile; DBT covering cash, in-kind and service-enabler categories; PFMS under the Department of Expenditure, Ministry of Finance; GFR comprehensively revised in **2017**; the SNA -> SNA-SPARSH succession; SNA-SPARSH integrating PFMS, State IFMIS and RBI e-Kuber for just-in-time release.

- **CURRENT:** **Verified 13 August 2026:** SNA-SPARSH originates in Department of Expenditure

OM No. 1(27)/PFMS/2020 dated 13 July 2023; a **10 June 2025** OM extended it to 37 further CSSs from **1 July 2025**; and from **1 November 2025** it applies to all CSSs in States/UTs with legislatures. **ANALYSIS:** Applicability by notification is not the same as verified operational onboarding for every scheme and State - say "applicable from", not "operational in all".

- **WRONG:** **Do not assert:** any cumulative DBT savings figure; beneficiary, scheme or transaction counts; authentication or payment failure rates; PFMS coverage percentages; procurement thresholds or portal statistics; any State's fund-utilisation figure.

- **ANALYSIS:** **Dashboard figures are reporting-date-bound and rise continuously.** The durable, exam-safe proposition is the **mechanism** - DBT's savings arise from removing fake, duplicate and ineligible entries - not any total.

CLOSING RECALL FLOW - CORE SYNTHESIS - OUTCOME MEASUREMENT, DATA QUALITY AND OWNERSHIP

START / CONCEPT: CORE SYNTHESIS - Outcome measurement, data quality and ownership

|
v

EXACT TERMS: CORE SYNTHESIS · Outcome measurement · data quality · ownership · Evidence chain · Qualified use

|
v

MECHANISM / ARGUMENT: Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint.

|
v

CONSEQUENCE / CONTRAST: T1 (scope): "DBT is a payments reform, not a welfare reform: it fixes who receives the money and when, and leaves untouched who is on the list and whether the benefit is the right one." T2 (error trade-off): "Every tightening of verification reduces inclusion error and increases exclusion error; for subsistence entitlements the governance question is not how to minimise total error but which error the state is willing to bear." T3 (fiscal federalism): "Just-in-time release genuinely eliminates idle float and genuinely constrains State cash planning - efficiency at the Union level is a real cost at the State level, and the reform is defensible only if that cost is acknowledged." T4 (rules vs capacity): "GFR and procurement rules discipline process and cannot produce value: the binding constraints on public procurement outcomes are specification quality, market competition and contract management, none of which a rulebook supplies."

|
v

UPSC TRAP / ANSWER-USE: No fixed cumulative savings figure is asserted here, since the DBT Mission/PFMS dashboard's reported savings figure rises continuously as more schemes and years are covered; the durable, exam-safe proposition is that DBT's savings arise specifically from removing fake, duplicate and ineligible beneficiary entries, not from a one-time reported total. ANALYSIS: SNA-SPARSH applied to a CSS illustrates just-in-time release through integrated financial systems, while also exposing implementation risks where State IFMIS/PFMS data or contribution reconciliation is delayed. ANALYSIS: PFMS provides sanction/payment and authorised management reporting, including "Know Your Payment"; not every internal utilisation trail is necessarily public at beneficiary level.

|
v

ANSWER-GRABBING FORMULATION: Evidence chain: Outcome measurement, data quality and honest question ownership Qualified use: Close a twenty-mark answer at the outcome stage with an explicit data boundary.

BASIC MCQS / REMEDIATION

Q1. Which statement correctly identifies The budget-to-beneficiary chain this owner holds?

A. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. B. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. C. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. D. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because

individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it.

Answer: A. Explanation: This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. The remaining options belong to different chronology, actor or analytical categories.

Q2. Which chronology card should be filed under The budget-to-beneficiary chain this owner holds?

A. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. B. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. C. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. D. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded.

Answer: B. Explanation: This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. The remaining options belong to different chronology, actor or analytical categories.

Q3. Which option preserves the source-bounded meaning of The budget-to-beneficiary chain this owner holds?

A. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. B. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. C. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. D. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all.

Answer: C. Explanation: This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. The remaining options belong to different chronology, actor or analytical categories.

Q4. Which statement avoids a close-option trap about The budget-to-beneficiary chain this owner holds?

A. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. B. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all. C. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard

error, because the release design has since been superseded. D. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions.

Answer: D. Explanation: This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. The remaining options belong to different chronology, actor or analytical categories.

Q5. Which statement correctly identifies The identity and payments foundation named JAM?

A. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. B. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. C. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. D. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level.

Answer: A. Explanation: The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. The remaining options belong to different chronology, actor or analytical categories.

Q6. Which chronology card should be filed under The identity and payments foundation named JAM?

A. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. B. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. C. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. D. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all.

Answer: B. Explanation: The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. The remaining options belong to different chronology, actor or analytical categories.

Q7. Which option preserves the source-bounded meaning of The identity and payments foundation named JAM?

A. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. B. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all. C. The JAM trinity is the

combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. D. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised.

Answer: C. Explanation: The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. The remaining options belong to different chronology, actor or analytical categories.

Q8. Which statement avoids a close-option trap about The identity and payments foundation named JAM?

A. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all. B. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. C. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. D. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it.

Answer: D. Explanation: The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it

executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. The remaining options belong to different chronology, actor or analytical categories.

Q9. Which statement correctly identifies Direct Benefit Transfer is a payments reform broader than cash?

A. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. B. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. C. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all. D. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded.

Answer: A. Explanation: Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. The remaining options belong to different chronology, actor or analytical categories.

Q10. Which chronology card should be filed under Direct Benefit Transfer is a payments reform broader than cash?

A. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. B. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. C. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. D. SNA-SPARSH is the current official just-in-time

architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all.

Answer: B. Explanation: Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. The remaining options belong to different chronology, actor or analytical categories.

Q11. Which option preserves the source-bounded meaning of Direct Benefit Transfer is a payments reform broader than cash?

A. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. B. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. C. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. D. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all.

Answer: C. Explanation: Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. The remaining options belong to different chronology, actor or analytical categories.

Q12. Which statement avoids a close-option trap about Direct Benefit Transfer is a payments reform broader than cash?

A. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. B. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. C. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. D. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed.

Answer: D. Explanation: Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. The remaining options belong to different chronology, actor or analytical categories.

Q13. Which statement correctly identifies The Public Financial Management System and the agency layer?

A. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. B. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. C. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. D. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all.

Answer: A. Explanation: The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. The remaining options belong to different chronology, actor or analytical categories.

Q14. Which chronology card should be filed under The Public Financial Management System and the agency layer?

A. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. B. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. C. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all. D. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named.

Answer: B. Explanation: The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. The remaining options belong to different chronology, actor or analytical categories.

Q15. Which option preserves the source-bounded meaning of The Public Financial Management System and the agency layer?

A. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. B. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. C. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies

down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. D. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised.

Answer: C. Explanation: The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. The remaining options belong to different chronology, actor or analytical categories.

Q16. Which statement avoids a close-option trap about The Public Financial Management System and the agency layer?

A. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. B. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. C. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. D. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level.

Answer: D. Explanation: The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. The remaining options belong to different chronology, actor or analytical categories.

Q17. Which statement correctly identifies The 2021 Single Nodal Agency model and its supersession?

A. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. B. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all. C. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. D. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised.

Answer: A. Explanation: The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. The remaining options belong to different chronology, actor or analytical categories.

Q18. Which chronology card should be filed under The 2021 Single Nodal Agency model and its supersession?

A. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. B. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. C. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. D. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires.

Answer: B. Explanation: The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. The remaining options belong to different chronology, actor or analytical categories.

Q19. Which option preserves the source-bounded meaning of The 2021 Single Nodal Agency model and its supersession?

A. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. B. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. C. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. D. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires.

Answer: C. Explanation: The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. The remaining options belong to different chronology, actor or analytical categories.

Q20. Which statement avoids a close-option trap about The 2021 Single Nodal Agency model and its supersession?

A. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. B. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. C. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. D. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so

that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded.

Answer: D. Explanation: The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. The remaining options belong to different chronology, actor or analytical categories.

Q21. Which statement correctly identifies SNA-SPARSH, just-in-time release and its dated notification trail?

A. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all. B. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. C. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. D. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised.

Answer: A. Explanation: SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all. The remaining options belong to different chronology, actor or analytical categories.

Q22. Which chronology card should be filed under SNA-SPARSH, just-in-time release and its dated notification trail?

A. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. B. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all. C. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. D. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix.

Answer: B. Explanation: SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all. The remaining options belong to different chronology, actor or analytical categories.

Q23. Which option preserves the source-bounded meaning of SNA-SPARSH, just-in-time release and its dated notification trail?

A. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. B. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. C. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from

rather than operational in all. D. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires.

Answer: C. Explanation: SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all. The remaining options belong to different chronology, actor or analytical categories.

Q24. Which statement avoids a close-option trap about SNA-SPARSH, just-in-time release and its dated notification trail?

A. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. B. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. C. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas. D. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all.

Answer: D. Explanation: SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all. The remaining options belong to different chronology, actor or analytical categories.

Q25. Which statement correctly identifies RBI e-Kuber as settlement infrastructure rather than policy?

A. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. B. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. C. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. D. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix.

Answer: A. Explanation: RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. The remaining options belong to different chronology, actor or analytical categories.

Q26. Which chronology card should be filed under RBI e-Kuber as settlement infrastructure rather than policy?

A. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. B. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. C. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. D. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove.

Answer: B. Explanation: RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. The remaining options belong to different chronology, actor or analytical categories.

Q27. Which option preserves the source-bounded meaning of RBI e-Kuber as settlement infrastructure rather than policy?

A. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. B. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. C. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. D. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas.

Answer: C. Explanation: RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. The remaining options belong to different chronology, actor or analytical categories.

Q28. Which statement avoids a close-option trap about RBI e-Kuber as settlement infrastructure rather than policy?

A. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas. B. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. C. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. D. RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised.

Answer: D. Explanation: RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release

chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised. The remaining options belong to different chronology, actor or analytical categories.

Q29. Which statement correctly identifies The General Financial Rules, 2017 as the procedural rulebook?

A. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. B. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. C. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. D. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires.

Answer: A. Explanation: The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. The remaining options belong to different chronology, actor or analytical categories.

Q30. Which chronology card should be filed under The General Financial Rules, 2017 as the procedural rulebook?

A. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas. B. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. C. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. D. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a

named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove.

Answer: B. Explanation: The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. The remaining options belong to different chronology, actor or analytical categories.

Q31. Which option preserves the source-bounded meaning of The General Financial Rules, 2017 as the procedural rulebook?

A. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. B. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. C. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. D. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas.

Answer: C. Explanation: The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. The remaining options belong to different chronology, actor or analytical categories.

Q32. Which statement avoids a close-option trap about The General Financial Rules, 2017 as the procedural rulebook?

A. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. B. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure

of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas. C. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. D. The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named.

Answer: D. Explanation: The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named. The remaining options belong to different chronology, actor or analytical categories.

Q33. Which statement correctly identifies Leakage, exclusion and inefficiency are three different failures?

A. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. B. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. C. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. D. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas.

Answer: A. Explanation: Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. The remaining options belong to different chronology, actor or analytical categories.

Q34. Which chronology card should be filed under Leakage, exclusion and inefficiency are three different failures?

A. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. B. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. C. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas. D. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number.

Answer: B. Explanation: Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. The remaining options belong to different chronology, actor or analytical categories.

Q35. Which option preserves the source-bounded meaning of Leakage, exclusion and inefficiency are three different failures?

A. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. B. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. C. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. D. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas.

Answer: C. Explanation: Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. The remaining options belong to different chronology, actor or analytical categories.

Q36. Which statement avoids a close-option trap about Leakage, exclusion and inefficiency are three different failures?

A. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. B. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. C. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. D. Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires.

Answer: D. Explanation: Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires. The remaining options belong to different chronology, actor or analytical categories.

Q37. Which statement correctly identifies Inclusion error and the instruments that reduce it?

A. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. B. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. C. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. D. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension

and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas.

Answer: A. Explanation: Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. The remaining options belong to different chronology, actor or analytical categories.

Q38. Which chronology card should be filed under Inclusion error and the instruments that reduce it?

A. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas. B. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. C. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. D. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number.

Answer: B. Explanation: Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. The remaining options belong to different chronology, actor or analytical categories.

Q39. Which option preserves the source-bounded meaning of Inclusion error and the instruments that reduce it?

A. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. B. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. C. Inclusion error is the

case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. D. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids.

Answer: C. Explanation: Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. The remaining options belong to different chronology, actor or analytical categories.

Q40. Which statement avoids a close-option trap about Inclusion error and the instruments that reduce it?

A. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. B. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. C. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. D. Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix.

Answer: D. Explanation: Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix. The remaining options belong to different chronology, actor or analytical categories.

Q41. Which statement correctly identifies Exclusion error and the correctives that reduce it?

A. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. B. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. C. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. D. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas.

Answer: A. Explanation: Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. The remaining options belong to different chronology, actor or analytical categories.

Q42. Which chronology card should be filed under Exclusion error and the correctives that reduce it?

A. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. C. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. D. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for

quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids.

Answer: B. Explanation: Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. The remaining options belong to different chronology, actor or analytical categories.

Q43. Which option preserves the source-bounded meaning of Exclusion error and the correctives that reduce it?

A. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. B. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. C. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. D. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids.

Answer: C. Explanation: Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. The remaining options belong to different chronology, actor or analytical categories.

Q44. Which statement avoids a close-option trap about Exclusion error and the correctives that reduce it?

A. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness. B. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable

suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. C. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. D. Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove.

Answer: D. Explanation: Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove. The remaining options belong to different chronology, actor or analytical categories.

Q45. Which statement correctly identifies Which error the design is willing to bear?

A. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas. B. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. C. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. D. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number.

Answer: A. Explanation: The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas. The remaining options belong to different chronology, actor or analytical categories.

Q46. Which chronology card should be filed under Which error the design is willing to bear?

A. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. B. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas. C. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. D. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately.

Answer: B. Explanation: The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas. The remaining options belong to different chronology, actor or analytical categories.

Q47. Which option preserves the source-bounded meaning of Which error the design is willing to bear?

A. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. B. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness. C. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas. D. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids.

Answer: C. Explanation: The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas. The remaining options belong to different chronology, actor or analytical categories.

Q48. Which statement avoids a close-option trap about Which error the design is willing to bear?

A. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. B. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness. C. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. D. The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas.

Answer: D. Explanation: The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas. The remaining options belong to different chronology, actor or analytical categories.

Q49. Which statement correctly identifies Why a reported savings figure is not a net welfare gain?

A. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. B. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. C. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and

last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. D. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids.

Answer: A. Explanation: Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. The remaining options belong to different chronology, actor or analytical categories.

Q50. Which chronology card should be filed under Why a reported savings figure is not a net welfare gain?

A. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. B. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. C. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. D. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness.

Answer: B. Explanation: Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. The remaining options belong to different chronology, actor or analytical categories.

Q51. Which option preserves the source-bounded meaning of Why a reported savings figure is not a net welfare gain?

A. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness. B. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. C. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. D. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default.

Answer: C. Explanation: Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. The remaining options belong to different chronology, actor or analytical categories.

Q52. Which statement avoids a close-option trap about Why a reported savings figure is not a net welfare gain?

A. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. B. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. C. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness. D. Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound

and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number.

Answer: D. Explanation: Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number. The remaining options belong to different chronology, actor or analytical categories.

Q53. Which statement correctly identifies The six-stage budget-to-beneficiary chain as a routing device?

A. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. B. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. C. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. D. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness.

Answer: A. Explanation: The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. The remaining options belong to different chronology, actor or analytical categories.

Q54. Which chronology card should be filed under The six-stage budget-to-beneficiary chain as a routing device?

A. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. B. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes;

leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. C. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. D. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness.

Answer: B. Explanation: The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. The remaining options belong to different chronology, actor or analytical categories.

Q55. Which option preserves the source-bounded meaning of The six-stage budget-to-beneficiary chain as a routing device?

A. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. B. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. C. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. Answer: C. Explanation: The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. The remaining options belong to different chronology, actor or analytical categories.

Q56. Which statement avoids a close-option trap about The six-stage budget-to-beneficiary chain as a routing device?

A. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. B. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. C. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. D. The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately.

Answer: D. Explanation: The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately. The remaining options belong to different chronology, actor or analytical categories.

Q57. Which statement correctly identifies Procurement failure points beyond corruption?

A. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. B. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. C. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness. D. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal

flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied.

Answer: A. Explanation: Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. The remaining options belong to different chronology, actor or analytical categories.

Q58. Which chronology card should be filed under Procurement failure points beyond corruption?

A. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. B. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. C. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness. D. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure.

Answer: B. Explanation: Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. The remaining options belong to different chronology, actor or analytical categories.

Q59. Which option preserves the source-bounded meaning of Procurement failure points beyond corruption?

A. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. B. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. C. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. D. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package.

Answer: C. Explanation: Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. The remaining options belong to different chronology, actor or analytical categories.

Q60. Which statement avoids a close-option trap about Procurement failure points beyond corruption?

A. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. B. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. C. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking

layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. D. Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids.

Answer: D. Explanation: Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids. The remaining options belong to different chronology, actor or analytical categories.

Q61. Which statement correctly identifies Procurement integrity instruments and the disclosure discipline?

A. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. B. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness. C. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. D. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure.

Answer: A. Explanation: The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. The remaining options belong to different chronology, actor or analytical categories.

Q62. Which chronology card should be filed under Procurement integrity instruments and the disclosure discipline?

A. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. B. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. C. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. D. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied.

Answer: B. Explanation: The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. The remaining options belong to different chronology, actor or analytical categories.

Q63. Which option preserves the source-bounded meaning of Procurement integrity instruments and the disclosure discipline?

A. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. B. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. C. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers,

independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. D. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure.

Answer: C. Explanation: The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default. The remaining options belong to different chronology, actor or analytical categories.

Q64. Which statement avoids a close-option trap about Procurement integrity instruments and the disclosure discipline?

A. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. B. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. C. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. D. The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default.

Answer: D. Explanation: The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from

bidding, and an honest answer names both sides instead of recommending more rules by default. The remaining options belong to different chronology, actor or analytical categories.

Q65. Which statement correctly identifies Rules discipline process and cannot by themselves produce value?

A. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness. B. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. C. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. D. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied.

Answer: A. Explanation: The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness. The remaining options belong to different chronology, actor or analytical categories.

Q66. Which chronology card should be filed under Rules discipline process and cannot by themselves produce value?

A. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. B. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness. C. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct

Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. D. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package.

Answer: B. Explanation: The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness. The remaining options belong to different chronology, actor or analytical categories.

Q67. Which option preserves the source-bounded meaning of Rules discipline process and cannot by themselves produce value?

A. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. B. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. C. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness. D. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package.

Answer: C. Explanation: The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with

responsiveness. The remaining options belong to different chronology, actor or analytical categories.

Q68. Which statement avoids a close-option trap about Rules discipline process and cannot by themselves produce value?

A. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. B. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. C. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. D. The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness.

Answer: D. Explanation: The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness. The remaining options belong to different chronology, actor or analytical categories.

Q69. Which statement correctly identifies Just-in-time release as an intergovernmental trade-off with uneven incidence?

A. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. B. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. C. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the

Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. D. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure.

Answer: A. Explanation: Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. The remaining options belong to different chronology, actor or analytical categories.

Q70. Which chronology card should be filed under Just-in-time release as an intergovernmental trade-off with uneven incidence?

A. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. B. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. C. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. D. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions.

Answer: B. Explanation: Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and

the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. The remaining options belong to different chronology, actor or analytical categories.

Q71. Which option preserves the source-bounded meaning of Just-in-time release as an intergovernmental trade-off with uneven incidence?

A. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. B. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. C. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. D. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions.

Answer: C. Explanation: Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. The remaining options belong to different chronology, actor or analytical categories.

Q72. Which statement avoids a close-option trap about Just-in-time release as an intergovernmental trade-off with uneven incidence?

A. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. B. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation

trail is public at beneficiary level. C. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. D. Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied.

Answer: D. Explanation: Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied. The remaining options belong to different chronology, actor or analytical categories.

Q73. Which statement correctly identifies Local-body finance and the three-source test?

A. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. B. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. C. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. D. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions.

Answer: A. Explanation: Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(d) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and

the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. The remaining options belong to different chronology, actor or analytical categories.

Q74. Which chronology card should be filed under Local-body finance and the three-source test?

A. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. B. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. C. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. D. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed.

Answer: B. Explanation: Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. The remaining options belong to different chronology, actor or analytical categories.

Q75. Which option preserves the source-bounded meaning of Local-body finance and the three-source test?

A. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. B. The Public Financial Management System, administered by the Department of Expenditure in the Ministry

of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. C. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. D. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed.

Answer: C. Explanation: Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. The remaining options belong to different chronology, actor or analytical categories.

Q76. Which statement avoids a close-option trap about Local-body finance and the three-source test?

A. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. B. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. C. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. D. Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure.

Answer: D. Explanation: Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(b) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and

the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure. The remaining options belong to different chronology, actor or analytical categories.

Q77. Which statement correctly identifies Outcome measurement, data quality and honest question ownership?

A. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. B. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. C. This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions. D. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed.

Answer: A. Explanation: Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. The remaining options belong to different chronology, actor or analytical categories.

Q78. Which chronology card should be filed under Outcome measurement, data quality and honest question ownership?

A. The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it. B. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. C. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed. D. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level.

Answer: B. Explanation: Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. The remaining options belong to different chronology, actor or analytical categories.

Q79. Which option preserves the source-bounded meaning of Outcome measurement, data quality and honest question ownership?

A. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. B. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. C. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output

reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. D. Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed.

Answer: C. Explanation: Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. The remaining options belong to different chronology, actor or analytical categories.

Q80. Which statement avoids a close-option trap about Outcome measurement, data quality and honest question ownership?

A. The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level. B. The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded. C. SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all. D. Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package.

Answer: D. Explanation: Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific

and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package. The remaining options belong to different chronology, actor or analytical categories.

PYQS AND ANSWER PRACTICE

VERIFIED PYQ OWNERSHIP AUDIT

One direct General Studies Paper-II Mains demand is routed to this topic across the audited ledgers, and its stem was confirmed word for word in the locally held OCR-searchable official question paper. The audited 2018-2023 Mains ledger routes the 2022 General Studies Paper-II demand on reforming the government delivery system through the Direct Benefit Transfer Scheme and its limitations to the Advanced companion, and the Basic owner records expressly that core routing supersedes that older Advanced pointer and holds all marks-bearing content for the budget-to-beneficiary chain, so the demand is answered from the core file. No further Mains demand and no objective demand in the audited 2018-2023, 2024-2025 or 2026 ledgers is routed to this topic, so no additional demand card is manufactured and no question is invented from the locally held papers. No official answer key or marking scheme is held locally for the routed demand, so the model solution below is an authored answer route rather than an official key, and no cumulative savings figure, beneficiary count, scheme count, failure rate, coverage percentage, procurement threshold or portal statistic is recorded or inferred anywhere.

OWNER PYQ LEDGER EXTRACTS

9. PYQ application

- ANALYSIS: No GS-II Mains question in the audited 2024-2025 papers names DBT/PFMS/SNA/GFR directly, but this file's financial-flow framework is directly relevant background for any question on implementation efficiency, leakage reduction or service-delivery effectiveness (see 02), and for GS-III-linked public-finance/subsidy-reform questions that intersect with GS-II governance-tool knowledge.
- ANALYSIS: Use the JAM-DBT-PFMS-SNA-GFR layered framework as the standard structuring device whenever a question asks how India has improved financial-flow transparency or reduced welfare-scheme leakage.

10. PYQ-based analytical application

- ANALYSIS: Where a question links technology/digital tools to welfare-delivery efficiency (echoing the 2025 e-governance user-centricity PYQ, see 05), use the E1/E2 inclusion-exclusion framework from this file to give a balanced, not one-sided, efficiency assessment of DBT specifically.
- ANALYSIS: Where a question touches Centre-State fiscal relations (a recurring GS-II theme), cite the SNA model's just-in-time release as a concrete, current illustration of the efficiency-versus-fiscal-flexibility tension between the Union and states.

Historical PYQ Integration (2018-2023)

Status: Question-level PYQ demand is integrated into this owner. **Provenance:** Audited local official-paper routing ledgers: _PYQ-ROUTING-MAINS-GS1-GS2-ESSAY-2018-2023.md.

- **Years represented:** 2022
- **Paper(s):** GS-II
- **Routed question demands:** 1

Year	Paper	Q	PYQ demand (neutral rendering)	Directive / format	Source status	Owner requirement
2022	GS-II	8	Direct Benefit Transfer as reform and its limitations	Comment · 10 marks · 150 words	Routed to owning topic	Prepare context, core dimensions, evidence/examples, counterpoint and a concise conclusion.

What this owner must now support

- Direct Benefit Transfer as reform and its limitations

The table integrates the examinable demand and paper metadata. It does not turn an unkeyed objective question into a solved answer, and it does not claim that lexical presence alone proves full conceptual sufficiency.

PYQ DEMAND CARD 1 - 2022 General Studies Paper-II

Demand: Reforming the government delivery system through the Direct Benefit Transfer Scheme is a progressive step, but it has its limitations too. Comment. Answer in 150 words for 10 marks.

Status: Routed by the audited 2018-2023 Mains ledger to the Advanced companion and answered from the Basic owner under the recorded core routing that supersedes the older Advanced pointer, and confirmed word for word in the locally held OCR-searchable official 2022 General Studies Paper-II. No official answer key is held locally, so the model solution is an authored answer route.

Model solution: Comment is an evaluative directive that requires a position with both sides shown, so the opening sentence must state precisely what was reformed rather than praising digitisation in general. Say that the scheme changed the route of a benefit, moving it from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and that this attacked identity-based leakage specifically. Give the mechanism in one line: population-scale identity together with universal bank access makes individual-level de-duplication possible at a scale that manual verification never allowed, which is why fake, duplicate and ineligible entries in ration-card, job-card and subsidy registries could be removed. Add the scope precision most answers miss, namely that the instrument is not only cash, because it also covers in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so equating it with cash transfer is a scope error. Concede the genuine gains before criticising, or the comment is one-sided: intermediation fell, timeliness improved for most recipients and an auditable payment trail now exists. Then take the limitations in the correct analytical order. First, the instrument addresses leakage and not targeting, so a wrong or outdated beneficiary list transfers money accurately to the wrong people. Second, exclusion error is created by the same verification mechanism, because authentication failure, seeding and name mismatch, missing documents, dormant or frozen accounts and distance deny genuine beneficiaries, and that failure falls hardest on manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas. Third, last-mile access matters, because a credited account is not money in hand where the banking correspondent, connectivity or distance intervenes. Fourth, cash is not a substitute for provision, so where a market does not exist or prices are volatile the transfer shifts price risk to the poorest. Fifth, payment-failure grievance is weak and often has no named addressee. Sixth, the savings claim measures the value of removed ineligible and duplicate entries rather than a net welfare gain, because it does not net out exclusion cost. Map correctives to those limitations rather than listing them loosely: assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision as a targeting fix rather than a payments fix, a payment-grievance route with a stated timeline, and the reporting of exclusion as a monitored metric alongside savings. Conclude with the verdict that this is a successful payments reform being asked to carry the weight of a targeting and provision reform it was never designed to deliver. Assert no cumulative savings figure, beneficiary count, scheme count or authentication-failure rate.

ORIGINAL MAINS 1 - 10 MARKS

Question: Distinguish the roles of Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture within India's public financial management. Answer in about 150 words.

Model thesis: The three tools are not synonyms but three layers answering three different failures, namely beneficiary-level identity leakage, agency-level diversion and idle balance, and Union-to-State release float, so the answer must assign each tool its own problem, mechanism and limitation rather than describing one digital system.

Claim -> named evidence -> analysis -> qualification:

- Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed.
- The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level.
- The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded.
- SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all.

Qualified conclusion: The three tools are not synonyms but three layers answering three different failures, namely beneficiary-level identity leakage, agency-level diversion and idle balance, and Union-to-State release float, so the answer must assign each tool its own problem, mechanism and limitation rather than describing one digital system.

ORIGINAL MAINS 2 - 10 MARKS

Question: Explain how just-in-time release in the current centrally sponsored scheme architecture alters Centre-State fiscal relations. Answer in about 150 words.

Model thesis: Just-in-time release converts a fiscal-efficiency gain at the Union level into a cash-planning constraint at the State level, so the answer must name the integration that makes it possible, the float it removes and the reconciliation load it creates, and must end with a negotiated balance rather than a one-sided efficiency mandate.

Claim -> named evidence -> analysis -> qualification:

- SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all.

- RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised.
- Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is defensible only where that cost is acknowledged rather than denied.
- The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately.

Qualified conclusion: Just-in-time release converts a fiscal-efficiency gain at the Union level into a cash-planning constraint at the State level, so the answer must name the integration that makes it possible, the float it removes and the reconciliation load it creates, and must end with a negotiated balance rather than a one-sided efficiency mandate.

ORIGINAL MAINS 3 - 15 MARKS

Question: Critically examine the proposition that Direct Benefit Transfer addresses leakage rather than targeting accuracy. Answer in about 250 words.

Model thesis: The proposition is correct but incomplete, because leakage, exclusion and inefficiency are three distinct failures and the same verification mechanism that reduces inclusion error raises exclusion error, so a critical examination must concede the genuine payments gain, separate the three failures and state which error the design is willing to bear.

Claim -> named evidence -> analysis -> qualification:

- Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires.
- Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix.
- Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove.
- The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas.

Qualified conclusion: The proposition is correct but incomplete, because leakage, exclusion and inefficiency are three distinct failures and the same verification mechanism that reduces inclusion error raises exclusion error, so a

critical examination must concede the genuine payments gain, separate the three failures and state which error the design is willing to bear.

ORIGINAL MAINS 4 - 15 MARKS

Question: Examine why reported savings from authenticated benefit transfer cannot by themselves establish that welfare delivery has improved. Answer in about 250 words.

Model thesis: A savings figure measures removed ineligible and duplicate entries rather than a net welfare gain, is bound to its reporting date and omits the exclusion cost, so the honest evaluation reports exclusion as a metric alongside savings and reasons from the mechanism instead of from a dashboard total.

Claim -> named evidence -> analysis -> qualification:

- Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number.
- Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove.
- Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires.
- Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package.

Qualified conclusion: A savings figure measures removed ineligible and duplicate entries rather than a net welfare gain, is bound to its reporting date and omits the exclusion cost, so the honest evaluation reports exclusion as a metric alongside savings and reasons from the mechanism instead of from a dashboard total.

ORIGINAL MAINS 5 - 20 MARKS

Question: Assess India's budget-to-beneficiary chain by locating the distinct failure at each stage and the instrument that addresses it. Answer in about 300 words.

Model thesis: The chain is a diagnostic device rather than a description, because each of its six stages fails in its own way and each failure has its own instrument, so a full assessment traces the money from appropriation to outcome, separates leakage, exclusion, inefficiency and federal capacity as distinct evaluative axes and closes with a reversal condition.

Claim -> named evidence -> analysis -> qualification:

- The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance,

specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately.

- The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level.
- Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids.
- Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package.

Qualified conclusion: The chain is a diagnostic device rather than a description, because each of its six stages fails in its own way and each failure has its own instrument, so a full assessment traces the money from appropriation to outcome, separates leakage, exclusion, inefficiency and federal capacity as distinct evaluative axes and closes with a reversal condition.

ORIGINAL MAINS 6 - 20 MARKS

Question: Assess whether procedural rules can deliver value for money in public procurement, and state what else is required. Answer in about 300 words.

Model thesis: Rules discipline process and cannot produce value, because specification quality, market competition and contract management determine outcomes and no rulebook supplies them, so the defensible position is that integrity instruments are necessary, insufficient and themselves costly in time and in supplier participation.

Claim -> named evidence -> analysis -> qualification:

- Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids.
- The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default.
- The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary

and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness.

- The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named.

Qualified conclusion: Rules discipline process and cannot produce value, because specification quality, market competition and contract management determine outcomes and no rulebook supplies them, so the defensible position is that integrity instruments are necessary, insufficient and themselves costly in time and in supplier participation.

OPTIONAL ADVANCED DEPTH - NOT REQUIRED FOR A CORE ANSWER

Subject: Governance | **Tier:** Advanced | **GS Paper:** GS-II, with GS-III public-finance links. **Core area:** DBT, JAM, PFMS, Single Nodal Agency and GFR, 2017 as financial-flow tools. **Grounded in:** DBT Mission; PFMS (Department of Expenditure); General Financial Rules, 2017; official UPSC GS-II syllabus. **FACT:** = source-grounded | **ANALYSIS:** = inference/analysis | **CURRENT:** = current anchor. *Companion:* basic/13_Public-Finance-and-Service-Delivery-Tools.md.

1. Architecture

Analytical claim: ANALYSIS: DBT's efficiency narrative (leakage/savings) and its equity risk (authentication-based exclusion) are two sides of the same identity-verification mechanism - a technically rigorous evaluation must present both, using the standard inclusion-error/ exclusion-error (Type I/Type II) framework from welfare-targeting economics.

2. Concepts and distinctions

Concept	Precise meaning
FACT: Leakage reduction vs targeting-error correction	DBT's identity-verification mechanism is specifically effective against <i>leakage</i> (benefits diverted to ineligible/fake/duplicate recipients); it does not correct <i>targeting errors</i> arising from flawed eligibility criteria or outdated beneficiary lists - the two are analytically distinct welfare-delivery problems requiring different solutions.
FACT: DBT vs PFMS vs SNA/SNA-SPARSH	DBT covers cash, in-kind and service-enabler transfer categories; PFMS is the financial-management/payment/tracking backbone; SNA/SNA-SPARSH govern CSS fund flow. They are linked but not synonyms.
ANALYSIS: Just-in-time release vs state flexibility	SNA-SPARSH's PFMS-State IFMIS-RBI e-Kuber design reduces float/borrowing costs and improves visibility, but creates integration, reconciliation, cyber-resilience and state cash-planning dependencies.
ANALYSIS: Rules-based procedural discipline (GFR) vs adaptive digital tracking (PFMS)	GFR, 2017 sets ex-ante procedural rules (sanctioning powers, procurement procedure, expenditure control classifications); PFMS provides ex-post/real-time tracking visibility - the two are complementary (rules plus monitoring), and neither substitutes for the other.

3. Detailed causal chain: from digital fund-flow tools to service-delivery outcome

- JAM foundation enables individual-level verification** at a scale that manual beneficiary-list verification could never achieve, providing the technical precondition for DBT.
- DBT's de-duplication mechanism** systematically removes fake, duplicate and ineligible entries from beneficiary databases (PDS ration cards, MGNREGA job cards, subsidy registries), producing measurable fiscal savings primarily through reduced inclusion error (E1).
- Authentication dependency risk:** the same verification mechanism that removes fake beneficiaries can, through biometric mismatch or connectivity failure, deny access to genuine beneficiaries - increasing exclusion error (E2) for a specific, usually vulnerable, subset of the eligible population (manual labourers with worn fingerprints, remote low-connectivity areas, elderly users).
- PFMS's fund-tracking layer** provides visibility into whether funds released for a scheme are actually reaching and being utilised by implementing agencies, independent of whether individual beneficiary transfers (DBT) or agency-routed expenditure is involved - addressing a different leakage risk (diversion at the agency/intermediary level) than DBT's beneficiary-level de-duplication.
- SNA-SPARSH's just-in-time release** closes a further fiscal-federalism inefficiency: states parking large upfront central transfers in low-utilisation accounts (sometimes earning float interest without corresponding expenditure progress) - SNA's release discipline directly targets this specific inefficiency, distinct from both DBT and PFMS's targets.
- GFR, 2017's procedural framework** underlies all of the above, setting the baseline sanctioning, procurement and expenditure-control rules that DBT/PFMS/SNA are designed to make more transparent and enforceable, rather than replace.

Deeper analytical layers

- ANALYSIS: A rigorous critique of DBT "savings" figures should note that reported savings typically measure the *value of removed ineligible/duplicate entries*, which is a different (and generally larger, easier-to-demonstrate) number than *net welfare gain*, which would need to net out any exclusion-error cost to genuine beneficiaries - a distinction worth making explicit in any critical evaluation, without needing to cite a specific disputed figure.
- ANALYSIS: SNA's just-in-time release model illustrates a recurring Centre-State fiscal-federalism tension also visible in GST compensation and centrally sponsored scheme design generally: Union-level efficiency/accountability tools can constrain state fiscal flexibility, requiring a negotiated balance rather than a one-sided efficiency mandate.
- ANALYSIS: PFMS's scheme-coverage expansion over time (from a narrower initial set of schemes to a much broader set of central and centrally sponsored schemes) illustrates incremental, successful institutional scaling of a financial-management IT system - a useful example of effective, if unglamorous, administrative-capacity building distinct from headline policy announcements.

4. Institutional and reform architecture

- FACT: The DBT Mission coordinates policy across ministries but does not itself administer individual schemes; actual DBT implementation and de-duplication occurs at the concerned ministry/scheme level, using PFMS and Aadhaar-linked verification as shared infrastructure.
- FACT: PFMS has progressively expanded its scheme coverage and functional scope (from fund tracking toward more granular expenditure and utilisation-certificate management) since its establishment. No fixed current scheme-coverage count is asserted here, since PFMS's coverage has grown from a narrower initial set of schemes toward a much broader set of central and centrally sponsored schemes and continues to expand.
- FACT: The General Financial Rules were comprehensively revised in 2017, consolidating and updating procurement, sanctioning and expenditure-control provisions, and remain the current consolidated rulebook; periodic further amendments have followed without a fresh comprehensive revision superseding the 2017 edition.
- ANALYSIS: The SNA model, applied progressively to more centrally sponsored schemes since its introduction, represents an evolving Union-level fiscal-discipline architecture. No fixed current list of SNA-covered schemes is asserted here, since coverage has expanded scheme by scheme since introduction rather than applying universally from the outset.

5. Indian applications and boundary cases

- ANALYSIS: A PDS or MGNREGA de-duplication exercise removing verified-fake job cards/ration cards illustrates DBT's E1-reduction strength in its clearest form.
- ANALYSIS: Boundary case: a genuinely eligible elderly pension beneficiary repeatedly failing biometric authentication due to worn fingerprints, resulting in denied or delayed disbursement, illustrates the E2 exclusion risk directly - the standard corrective (manual override/exception handling) reintroduces some of the discretion-based leakage risk DBT was designed to reduce, a genuine trade-off.
- ANALYSIS: A state receiving just-in-time SNA-routed funds for a centrally sponsored scheme, unable to front-load expenditure at the start of a financial year due to the release schedule, illustrates the fiscal-flexibility cost of the SNA model for state-level implementation planning.

6. Limitations and trade-offs

- ANALYSIS: DBT's de-duplication strength in reducing E1 (inclusion error/leakage) must be weighed against its E2 risk (exclusion error) - a comprehensive evaluation cannot treat DBT as an unambiguous, costless efficiency gain.
- ANALYSIS: SNA's just-in-time release improves Union-level fiscal discipline and visibility but constrains state-level fiscal flexibility and planning autonomy, a real intergovernmental- relations cost.
- ANALYSIS: PFMS's expanding scope improves transparency but requires continuous data-quality

investment (accurate, timely agency-level reporting) to remain a reliable tracking tool; data-entry quality at the implementing-agency level is a persistent, under-examined constraint on PFMS's actual reliability.

7. Must-Know Facts for Advanced Prelims

- FACT: DBT's leakage-reduction mechanism operates primarily through identity-based de-duplication (removing fake/duplicate/ineligible beneficiaries), a different function from correcting flawed eligibility-targeting criteria.
- FACT: The Single Nodal Agency model is specifically applied to centrally sponsored schemes' Union-to-state fund flow, distinct from PFMS's broader scheme-expenditure tracking role and DBT's beneficiary-transfer role.
- FACT: The General Financial Rules were comprehensively revised in 2017 and continue to undergo periodic amendment.

8. Advanced Prelims traps

- WRONG: DBT, PFMS and SNA are three names for the same system. -> They operate at three distinct layers - beneficiary transfer (DBT), scheme-wide fund tracking (PFMS), and Union-to-state release discipline for centrally sponsored schemes (SNA) - and should not be conflated.
- WRONG: Reported DBT "savings" figures represent net welfare gain. -> They typically represent the value of removed ineligible/duplicate entries (leakage reduction), not a net figure accounting for any exclusion-error cost to genuine beneficiaries.
- WRONG: The SNA model applies uniformly across all Union-to-state fund transfers. -> It applies specifically to designated centrally sponsored schemes, not to all forms of Union fiscal transfer to states (e.g., Finance Commission grants operate under a different mechanism).

9. CURRENT: Current-anchor note

- CURRENT: **Status checked 21 July 2026:** Department of Expenditure's 2025 schedule moved CSS toward SNA-SPARSH coverage through RBI e-Kuber. Universal scheduled coverage is not the same as error-free operational integration; state onboarding, contribution matching and reconciliation remain implementation tests.

10. PYQ-based analytical application

- ANALYSIS: Where a question links technology/digital tools to welfare-delivery efficiency (echoing the 2025 e-governance user-centricity PYQ, see 05), use the E1/E2 inclusion-exclusion framework from this file to give a balanced, not one-sided, efficiency assessment of DBT specifically.
- ANALYSIS: Where a question touches Centre-State fiscal relations (a recurring GS-II theme), cite the SNA model's just-in-time release as a concrete, current illustration of the efficiency-versus-fiscal-flexibility tension between the Union and states.

11. Mains-ready framework

Central thesis: India's DBT-PFMS-SNA-GFR financial-flow architecture demonstrably reduces identity-based leakage and improves fund-flow transparency, but each tool addresses a distinct problem (beneficiary-level leakage, agency-level fund tracking, Union-state release discipline respectively) and each carries a genuine trade-off (exclusion risk, fiscal-flexibility cost, data-quality dependency) that a rigorous evaluation must state explicitly rather than presenting the architecture as a costless efficiency gain.

1. Distinguish DBT, PFMS and SNA by the specific layer/problem each addresses.
2. Apply the inclusion-error/exclusion-error framework to any DBT efficiency claim.
3. Cite the SNA model's Centre-State fiscal-flexibility trade-off where relevant.
4. Note GFR, 2017 as the underlying procedural framework, not a separate reform.
5. Recommend targeted correctives (manual-override safeguards for exclusion risk, data-quality investment for PFMS reliability) rather than an unqualified endorsement.
6. Add a federal implementation dashboard: Union release latency, state matching share,

payment failure, reconciliation exceptions and beneficiary grievance resolution.

12. Probable questions

- ANALYSIS: **Prelims**: Which Union government system tracks fund flow from budgetary sanction to implementing-agency utilisation across schemes?
- ANALYSIS: **Mains (15 marks)**: "Direct Benefit Transfer's efficiency gain and its exclusion risk arise from the same verification mechanism." Critically examine.
- ANALYSIS: **Mains (10 marks)**: Explain the Single Nodal Agency model's effect on Centre-State fiscal relations in centrally sponsored schemes.

13. Study links

- Direct Benefit Transfer as reform and its limitations

The table integrates the examinable demand and paper metadata. It does not turn an unkeyed objective question into a solved answer, and it does not claim that lexical presence alone proves full conceptual sufficiency.

CONSOLIDATED REGISTER NOTES

Public Finance and Service-Delivery Tools: RAPID INSTITUTION, INSTRUMENT AND EVIDENCE MAP

1. **The budget-to-beneficiary chain this owner holds**: This topic owns the financial-flow chain that runs from budgetary appropriation to a delivered benefit, namely the Jan Dhan, Aadhaar and Mobile foundation, Direct Benefit Transfer, the Public Financial Management System, the Single Nodal Agency architecture and the General Financial Rules, 2017, together with procurement at the front end and outcome measurement at the back end of the same chain; the Aadhaar identity design itself is held by the digital public infrastructure owner and the constitutional status of the third tier by Polity, so this owner analyses how money moves and where delivery fails rather than restating identity architecture or constitutional provisions.
2. **The identity and payments foundation named JAM**: The JAM trinity is the combination of Jan Dhan universal bank-account access, Aadhaar unique identity and Mobile connectivity, and it is the technical precondition for targeted, verifiable benefit transfer at population scale because individual-level de-duplication needs a verifiable person, a usable account and a notification channel; the Department of Financial Services, whose official website

was read on 2 September 2026, states that it is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to banking, insurance and pension, and that it executes reforms including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens, and nothing beyond that statement of role is imported from it.

3. **Direct Benefit Transfer is a payments reform broader than cash:** Direct Benefit Transfer changed the route of a benefit from intermediated, physically distributed or price-subsidised delivery to authenticated transfer to a verified beneficiary, and it covers cash transfers to individuals, in-kind benefits delivered through authenticated systems and certain transfers to service enablers, so treating it as a synonym for cash transfer is a scope error; its distinctive achievement is that population-scale identity plus universal bank access makes individual-level de-duplication possible at a scale manual verification never allowed.
4. **The Public Financial Management System and the agency layer:** The Public Financial Management System, administered by the Department of Expenditure in the Ministry of Finance, tracks government funds end to end from budgetary sanction through release to implementing agencies down to actual utilisation, and it supplies sanction, payment and authorised management reporting including the Know Your Payment facility, so it addresses diversion and idle balances at the agency and intermediary level, which is a different leakage risk from the beneficiary-level risk that Direct Benefit Transfer addresses; not every internal utilisation trail is public at beneficiary level.
5. **The 2021 Single Nodal Agency model and its supersession:** The Single Nodal Agency model introduced in 2021 used a designated agency and account structure for each centrally sponsored scheme so that scheme balances held in State accounts became visible, and it applies specifically to the State-level fund flow of centrally sponsored schemes rather than to central-sector schemes, to Finance Commission grants or to government expenditure generally; describing that bank-account model as the whole of the present architecture is the standard error, because the release design has since been superseded.
6. **SNA-SPARSH, just-in-time release and its dated notification trail:** SNA-SPARSH is the current official just-in-time architecture for centrally sponsored schemes and integrates the Public Financial Management System, the State Integrated Financial Management Information System and RBI e-Kuber so that Union and State shares are released together against actual expenditure claims instead of being parked in advance; it was introduced by Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023, an Office Memorandum of 10 June 2025 extended it to thirty-seven further schemes from 1 July 2025, and from 1 November 2025 it applies to all centrally sponsored schemes in States and Union Territories with legislatures, as re-verified by the owners on 13 August 2026; applicability by notification is not verified operational onboarding, so the defensible formulation is applicable from rather than operational in all.
7. **RBI e-Kuber as settlement infrastructure rather than policy:** RBI e-Kuber settles transfers between the Union's account and the State's account at the Reserve Bank of India without commercial-bank float, and it is an infrastructure component of the release chain rather than a policy instrument in its own right, so an answer that presents it as a reform misplaces it; its function is to make just-in-time release technically possible once the scheme share and the expenditure claim have been authorised.
8. **The General Financial Rules, 2017 as the procedural rulebook:** The General Financial Rules were comprehensively revised in 2017 and remain the Union government's consolidated rulebook on financial management, budgeting, sanctioning, procurement and expenditure control, and Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture all operate within them rather than replacing them; periodic amendments have followed without a fresh comprehensive revision superseding the 2017 edition, so the year must be cited whenever the rulebook is named.
9. **Leakage, exclusion and inefficiency are three different failures:** Leakage means a benefit diverted to someone not entitled to it, exclusion means a benefit never reaching an eligible person, and inefficiency means a benefit delivered at excessive cost, and these are three separate failures needing three different instruments that are routinely merged into the single phrase about plugging the leakages, which is why such recommendations rarely change outcomes; naming which of the three a stem is actually about is the first analytical move this topic requires.
10. **Inclusion error and the instruments that reduce it:** Inclusion error is the case in which an ineligible person receives the benefit, and it arises from fake or duplicate entries, from outdated lists and from false declaration, so the instruments that reduce it are authentication, de-duplication and verification; every tightening of those

instruments raises exclusion error, which is why inclusion error cannot be minimised in isolation and why de-duplication is a payments fix rather than a list fix.

11. **Exclusion error and the correctives that reduce it:** Exclusion error is the case in which an eligible person does not receive the benefit, and it arises from authentication failure, from seeding and name mismatch, from missing documents, from distance, from dormant or frozen accounts and from lists that are never revised, so the correctives are assisted and offline authentication fallback, exception handling with a named officer, periodic beneficiary-list revision and a payment-grievance route with a stated timeline; each corrective raises inclusion error and administrative cost, and manual override reintroduces part of the discretion that authenticated transfer was designed to remove.
12. **Which error the design is willing to bear:** The examinable judgment is that inclusion error is a fiscal cost to the state while exclusion error is a subsistence cost to a person, so for food, pension and wage entitlements the asymmetry justifies tolerating some inclusion error in order to protect against exclusion, and the marks are earned by stating which error the design is optimising against and why, rather than by claiming that total targeting error can be minimised; the failure of authentication falls hardest on the least-equipped, including manual labourers with worn fingerprints, elderly users and residents of low-connectivity areas.
13. **Why a reported savings figure is not a net welfare gain:** Reported Direct Benefit Transfer savings typically measure the value of removed ineligible and duplicate entries, which is a different and generally larger number than a net welfare gain because it does not net out the exclusion cost borne by genuine beneficiaries, and dashboard totals are reporting-date-bound and rise continuously as more schemes and years are covered; the durable, exam-safe proposition is therefore the mechanism, namely that savings arise from removing fake, duplicate and ineligible entries, and no cumulative rupee total may be asserted as a permanently citable number.
14. **The six-stage budget-to-beneficiary chain as a routing device:** The chain runs budget, release, agency, procurement, beneficiary and outcome, and each stage carries its own characteristic failure, namely an unrealistic outlay, delay and float and parking, diversion and idle balance, specification and competition and contract-management failure, exclusion and last-mile cash access, and the counting of outputs in place of outcomes; leakage stems sit at stages three to five, delay stems at stage two, value-for-money stems at stage four and did-it-work stems at stage six, so answering a procurement demand with benefit-transfer material is a routing error the examiner will see immediately.
15. **Procurement failure points beyond corruption:** Union procurement operates within the General Financial Rules, 2017 and the applicable procurement rules and manuals with the stated objective of value for money together with transparency, competition, fairness and non-discrimination, and its failures extend well beyond corruption to over-specified or vendor-tailored specifications, to single-bid and limited-competition outcomes, to lowest-cost selection for quality-dependent services, to weak contract management after award and to inadequate capacity to evaluate technically complex bids.
16. **Procurement integrity instruments and the disclosure discipline:** The integrity instruments a governance answer should name are conflict-of-interest disclosure, debarment of defaulting suppliers, independent complaint handling before award and audit of the award decision, together with the discipline that confidentiality of adverse information does not extinguish the duty to disclose the risk to the competent authority; the accompanying trade-off is that tighter procurement rules raise process integrity while lengthening timelines and deterring capable suppliers from bidding, and an honest answer names both sides instead of recommending more rules by default.
17. **Rules discipline process and cannot by themselves produce value:** The General Financial Rules and the procurement rules supply ex-ante procedural discipline while the Public Financial Management System supplies real-time and ex-post tracking visibility, so the two are complementary and neither substitutes for the other, and the binding constraints on procurement outcomes are specification quality, market competition and contract management, none of which a rulebook can supply; the rules-against-capacity answer therefore concedes that predictability is bought with responsiveness.
18. **Just-in-time release as an intergovernmental trade-off with uneven incidence:** Just-in-time release genuinely removes idle float and genuinely constrains State cash planning, so efficiency at the Union level is purchased with State fiscal flexibility and with a heavy reconciliation load on implementing agencies, and the incidence is uneven because the beneficiary bears authentication, travel and account-access cost, the banking correspondent is the actual last mile with commission incentives, the State finance department loses a cash buffer and gains reporting obligations, and the Union ministry gains visibility and real-time control; the reform is

defensible only where that cost is acknowledged rather than denied.

19. **Local-body finance and the three-source test:** Article 280(3)(bb) directs the Union Finance Commission to recommend measures to augment a State's Consolidated Fund in order to supplement Panchayat resources and Article 280(3)(c) does the same for Municipalities, in each case on the basis of State Finance Commission recommendations, and the three-source test asks whether a local body has own revenue, State devolution through its Finance Commission and Union Finance Commission grants, because a body dependent on the third source alone has spending capacity without fiscal autonomy; tied grants protect national service priorities while untied resources preserve local choice, and transfer becomes accountable only with audited accounts, predictable release, a transparent formula and public disclosure.
20. **Outcome measurement, data quality and honest question ownership:** Outcome budgeting and the output-outcome monitoring framework attach outcome indicators to financial allocation and form the back end of the chain, although coverage is scheme-specific and output reporting still dominates, while the reliability of the tracking layer depends on accurate and timely data entry at the implementing-agency level, which is a persistent and under-examined constraint. On ownership, the audited 2018-2023 Mains ledger routes one General Studies Paper-II demand on Direct Benefit Transfer as a reform and its limitations to this topic, the Basic owner records that core routing supersedes the older pointer to the Advanced companion, and no cumulative savings figure, beneficiary or scheme count, authentication or payment-failure rate, tracking-coverage percentage, procurement threshold, portal statistic or State fund-utilisation figure is asserted anywhere in this package.

Public Finance and Service-Delivery Tools: CLOSE-OPTION AND CAUSAL TRAPS

- Do not treat Direct Benefit Transfer as a synonym for cash transfer, because it also covers in-kind and service-enabler categories.
- Do not claim that Direct Benefit Transfer eliminates every form of leakage, because it addresses identity-based leakage and not targeting error or scheme-design quality.
- Do not conflate Direct Benefit Transfer, the Public Financial Management System and the Single Nodal Agency architecture, because they operate at three different layers.
- Do not extend the Single Nodal Agency architecture to central-sector schemes, to Finance Commission grants or to government expenditure generally.
- Do not describe the 2021 bank-account Single Nodal Agency model as the whole of the current release architecture.
- Do not convert applicability by notification into verified operational onboarding for every scheme and every State.
- Do not cite any cumulative Direct Benefit Transfer savings figure, beneficiary count, scheme count or authentication-failure rate.
- Do not present a reported savings figure as a net welfare gain, because it does not net out exclusion cost.
- Do not assert a tracking-coverage percentage for the Public Financial Management System or a fund-utilisation figure for any State.
- Do not assert a procurement threshold value, a portal's transaction volume or a percentage of tenders on any platform.
- Do not name the General Financial Rules without the 2017 comprehensive revision, and do not claim a later comprehensive revision has superseded it.
- Do not treat RBI e-Kuber as a policy reform rather than as settlement infrastructure within the release chain.
- Do not answer a procurement or outcome demand with benefit-transfer material, because that is a stage-routing error.
- Do not present just-in-time release as costless for State cash planning or for agency reconciliation.
- Do not restate Aadhaar identity design or the constitutional status of local bodies, which other owners hold.
- Do not claim that total targeting error can be minimised, because reducing one error necessarily raises the other.

Public Finance and Service-Delivery Tools: ANSWER-WRITING SPINE

NAME THE NORM OR PROBLEM -> IDENTIFY THE DUTY-HOLDER AND THE BINDING FORM
-> GROUP NAMED EVIDENCE BY MECHANISM: STATUTE, RULE, SCHEME OR EXECUTIVE POLICY
-> LOCATE THE STAGE AT WHICH THE MECHANISM STOPS AND STATE THE REMEDY GAP
-> SEPARATE MEASURED OUTPUT FROM REALISED OUTCOME AND SCOPE FROM TERRITORIAL EXTENT
-> CLOSE WITH A GRADED VERDICT AND AN EXPLICIT STATUS OR DATA CAVEAT

Public Finance and Service-Delivery Tools: CURRENT-STATUS AND DATA BOUNDARY

One live official page was verified for this topic on 2026-09-02. The Department of Financial Services website at financialservices.gov.in was read successfully on that date and states that the Department is the nodal Department for the banking, financial services and insurance sector, that it administers various Acts relating to the banking, insurance and pension sectors, and that it executes initiatives and reforms concerning those sectors including the adoption of technology and cybersecurity measures to ensure ease, availability and security of financial services to citizens; that statement of role is used and nothing else is inferred from it, and in particular no account, transaction, coverage or savings statistic is imported. Four further official checks were attempted on the same date and returned no usable official text, namely the Direct Benefit Transfer Mission portal, which returned only an empty modal string with no substantive content, the Public Financial Management System public entry page, which redirected to a login error, and the Department of Expenditure website, which failed at the transport level, so no content from any of them was read or used and no secondary summary has been treated as an official source. The remaining dated official elements used are those already carried by the repository owners with their status checks, namely Department of Expenditure Office Memorandum No. 1(27)/PFMS/2020 dated 13 July 2023 introducing SNA-SPARSH, the Office Memorandum of 10 June 2025 extending it to thirty-seven further centrally sponsored schemes from 1 July 2025, its application from 1 November 2025 to all centrally sponsored schemes in States and Union Territories with legislatures, the comprehensive revision of the General Financial Rules in 2017, the administration of the Public Financial Management System by the Department of Expenditure, and Article 280(3)(bb) and Article 280(3)(c) for Union Finance Commission local-body grants, all as checked by the owners on 21 July 2026 and 13 August 2026. Applicability by notification is expressly distinguished from verified operational onboarding, so no claim of universal operational completion is made. No cumulative Direct Benefit Transfer savings figure is asserted, no beneficiary, scheme or transaction count is asserted, no authentication or payment-failure rate is asserted, no tracking-coverage percentage is asserted, no procurement threshold value, portal transaction volume or share of tenders is asserted, and no State fund-utilisation figure is asserted. The Aadhaar identity architecture is cross-linked to the digital public infrastructure owner and the constitutional status of local bodies to Polity rather than restated here.

COMPLETE TOPIC ASCII MASTER FLOW DIAGRAM

High-yield use: Follow the panels as one topic-specific conceptual atlas: root question, classifications, processes or arguments, comparisons, objections and a final answer-writing spine. This text-native master is separate from both graphical flowchart artifacts.

ASCII MASTER FLOW - PANEL 1/12: Budget-to-beneficiary chain

1 BUDGET -> appropriation, scheme approval, outlay; failure: an unrealistic outlay
2 RELEASE -> Union to State or agency, just-in-time via e-Kuber; failure: delay, float
3 AGENCY -> agency receives, incurs and reports; failure: diversion and idle balance
4 PROCUREMENT -> goods, works and services under the rules; failure: specification, cartel
5 BENEFICIARY -> transfer or service delivered; failure: exclusion, last-mile cash access
6 OUTCOME -> did the money change anything; failure: outputs counted in place of outcomes

ASCII MASTER FLOW - PANEL 2/12: The tool stack and the problem each solves

JAM -> the precondition: a verifiable person, a usable account, a notification channel
DIRECT BENEFIT TRANSFER -> identity-based leakage from fake, duplicate, ineligible entries
PUBLIC FINANCIAL MANAGEMENT SYSTEM -> diversion and idle balances at the agency level
SNA-SPARSH -> float and advance parking in the centrally sponsored scheme release chain
GENERAL FINANCIAL RULES, 2017 -> procedural discipline over sanction and procurement

ASCII MASTER FLOW - PANEL 3/12: The JAM foundation

JAN DHAN -> universal bank-account access as the destination of a transfer
AADHAAR -> unique identity that makes individual-level de-duplication possible
MOBILE -> the transaction and notification channel that closes the loop
LIMIT -> an account that exists is not always an account the holder can actually use

ASCII MASTER FLOW - PANEL 4/12: Scope card for authenticated transfer

CASH -> transfers credited to an individual verified beneficiary account
IN KIND -> benefits delivered through authenticated systems rather than credited
SERVICE ENABLERS -> certain transfers made to those who enable the service
SCOPE ERROR -> equating the instrument with cash transfer alone

ASCII MASTER FLOW - PANEL 5/12: Release architecture succession

2021 -> Single Nodal Agency model: designated agency and account per scheme
13 JULY 2023 -> Office Memorandum No. 1(27)/PFMS/2020 introduces SNA-SPARSH
10 JUNE 2025 OM -> thirty-seven further schemes brought in from 1 July 2025
1 NOVEMBER 2025 -> applies to all such schemes in States and Union Territories with legislatures
BOUNDARY -> applicable from is provable; operational in all is not

ASCII MASTER FLOW - PANEL 6/12: Just-in-time release mechanism

INTEGRATION -> Public Financial Management System plus State IFMIS plus RBI e-Kuber
RULE -> Union and State shares released together against an actual expenditure claim
GAIN -> idle float and advance parking are removed from the release chain
COST -> State cash-planning buffer is lost and agency reconciliation load rises

ASCII MASTER FLOW - PANEL 7/12: Error matrix

E1 INCLUSION ERROR -> an ineligible person receives; cause: fake, duplicate, outdated lists
E1 INSTRUMENTS -> authentication, de-duplication, verification; cost: raises E2
E2 EXCLUSION ERROR -> an eligible person is denied; cause: authentication and seeding failure
E2 CORRECTIVES -> offline fallback, named exception officer, list revision, timed grievance

ASCII MASTER FLOW - PANEL 8/12: Which error the state chooses to bear

E1 -> a fiscal cost falling on the exchequer and recoverable in later years
E2 -> a subsistence cost falling on one person in the year the benefit was needed
-> FOR FOOD, PENSION AND WAGE ENTITLEMENTS the asymmetry favours tolerating some E1
-> INCIDENCE: worn fingerprints, elderly users and low-connectivity areas bear E2 first
ANSWER MOVE -> say which error the design optimises against and why

ASCII MASTER FLOW - PANEL 9/12: Three failures, three instruments

LEAKAGE -> benefit diverted to someone not entitled; instrument: de-duplication, tracking
EXCLUSION -> benefit never reaches an eligible person; instrument: fallback and grievance
INEFFICIENCY -> benefit delivered at excessive cost; instrument: procurement and design
ERROR -> merging all three into plugging the leakages produces recommendations that fail

ASCII MASTER FLOW - PANEL 10/12: Procurement failure and integrity map

SPECIFICATION -> over-specified or vendor-tailored terms narrow the field before bidding
COMPETITION -> single-bid and limited-competition outcomes remove the price discipline
SELECTION -> lowest-cost selection for quality-dependent services buys the wrong thing
AFTER AWARD -> weak contract management and thin technical evaluation capacity
INTEGRITY -> disclosure, debarment, independent complaint handling, audit of the award
TRADE-OFF -> tighter rules raise integrity, lengthen timelines and deter capable suppliers

ASCII MASTER FLOW - PANEL 11/12: Local-body finance three-source test

SOURCE 1 -> own revenue raised by the local body itself
SOURCE 2 -> State devolution on State Finance Commission recommendations
SOURCE 3 -> Union Finance Commission grants under Article 280(3)(bb) and Article 280(3)(c)
TEST -> dependence on source three alone is spending capacity without fiscal autonomy
CONDITION -> audited accounts, predictable release, transparent formula, public disclosure

ASCII MASTER FLOW - PANEL 12/12: Answer spine for a financial-flow demand

OPEN -> name the stage of the chain the stem occupies and the failure that belongs to it
BUILD -> assign each tool its own problem, mechanism and limitation, never one system
CORRECT -> separate leakage, exclusion and inefficiency and state which error is borne
CLOSE -> graded verdict with the reporting-date caveat and no dashboard total asserted
