

RBI, MONETARY POLICY AND LIQUIDITY MANAGEMENT

One continuous decision rail: statute -> target -> MPC -> corridor -> liquidity -> transmission -> limits

Current facts checked 09 SEP 2026

1 ORIGIN AND LEGAL IDENTITY

- Statutory, not constitutional; Section 7 preserves a public-interest direction power

2 FUNCTIONS WITH BOUNDARIES

A

- Currency: RBI banknotes; Government issues the one-rupee note
- Banking: banker/debt manager to governments; bankers' bank, settlement and last resort

B

- External: reserves and intervention against disorderly movement, not a fixed rupee target
- Regulation: only assigned banking/payment domains; no power to tax, spend or legislate

3 FLEXIBLE INFLATION TARGET

01 RBI Act s.45ZA: Central Government determines target in consultation with RBI

02 Gazette 25 March 2026: headline CPI target 4%; tolerance 2-6%

03 Current period: 1 April 2026 to 31 March 2031; review once every five years

04 Primary objective: price stability while keeping growth in mind

4 MPC: WHO DECIDES THE POLICY RATE?

5 VOTE, PUBLICATION AND FAILURE

6 CORRIDOR AND CURRENT SNAPSHOT

- Stance: neutral. These rates are dated observations and must be rechecked.
- WACR is the overnight operating target; RBI uses two-way liquidity operations
- WACR alignment is first-mile transmission, not proof of equal retail pass-through

LEGAL / OPERATIONAL INSTRUMENT DECODER

A

- SDF: standing, uncollateralised absorption; corridor floor since April 2022
- MSF: eligible scheduled banks; overnight collateralised backstop; ceiling
- CRR: RBI Act s.42, cash with RBI | SLR: BR Act s.24, bank-held liquid assets

B

- FRRR retained at RBI discretion, but no longer floor; Bank Rate is reference/penalty-linked
- Checked 9 September 2026: CRR 3.00%, SLR 18.00% - recheck before reuse

TRANSIENT AND DURABLE LIQUIDITY

A

- Framework dated 30 September 2025: primarily 7-day VRR/VRRR plus O/N-to-14-day discretion
- Transient drivers: currency, tax/spending, government cash and settlement

B

- Durable tools: OMO, long variable operations and forex swaps
- Operation Twist reshapes maturity supply; MSS locks proceeds in a separate restricted account

MONEY, CREDIT AND BANK STRESS

$$m = M3 / M0$$

M0 = currency + bankers' RBI deposits + other RBI deposits

- Empirical multiplier = M3/M0; never freeze it as 1/CRR
- Credit depends on reserves, capital, funding, risk, regulation and borrower demand
- Liquidity is payment timing; solvency is viability/net worth; last-resort cash is not capital

FIVE TRANSMISSION CHANNELS

A

- Interest rate -> WACR, deposits, lending and spending
- Credit -> funding, collateral, bank balance sheets and loan supply
- Expectations -> wages, prices and contracts | Exchange rate -> imported prices/net exports

B

- Asset prices -> wealth, collateral and financing costs
- EBLR can reset faster; MCLR, spreads, legacy loans and lags remain

- Approx real policy rate = nominal repo - expected inflation; neutral r-star is estimated
- Policy stance is not liquidity stance: neutral can coexist with surplus operations
- Supply shock: contain second rounds; Government repairs supply/logistics and targets relief
- FX intervention smooths excessive volatility; sterilisation separately offsets rupee liquidity

01 Assets: foreign assets, gold, G-secs, liquidity claims | Liabilities: notes and deposits

02 Notes issued are liabilities; seigniorage is not face value as annual profit

03 Answer: diagnose -> assign Government/MPC/RBI -> choose tool -> trace five channels

04 Qualify lags, distribution, solvency, supply and external limits

05 Cross-link Topic 3 for inflation measurement and Topic 5 for banking structure

QUALIFIED VERDICT

Credible nominal anchor + disciplined corridor + flexible liquidity + realistic transmission + coordinated supply response.
