

COMPLETE LEARNING SESSION

Economy Topic 29: Agricultural Technology Missions and Mission-Mode Policy

Complete Learning Session

LEARNING PATH

Deterministic fallback visual: move from precise concepts through argument and critique to exam application.

Source order: repository knowledge -> official current linkage -> clearly marked analysis. No fabricated PYQs or statistics.

CONTENTS / SESSION INDEX

Major learning parts and meaningful subtopics are listed in document order. Page numbers are generated from the final PDF layout; PDF bookmarks mirror the same hierarchy.

Economy Topic 29: Agricultural Technology Missions and Mission-Mode Policy 5

Source and Status Control 5

Economy Topic 29: Agricultural Technology Missions and Mission-Mode Policy

Source and Status Control

Current-status cutoff: 10 September 2026. Every mission is labelled historical, current, subsumed, restructured, completed, announced or approval-qualified.

Repository sources checked first

- upsc-ai-kit\knowledge\Economy\basic\29_Agricultural-Technology-Missions-and-Mission-Mode-Policy.md
- upsc-ai-kit\knowledge\Economy\advanced\29_Agricultural-Technology-Missions-and-Mission-Mode-Policy.md
- Economy agriculture cross-links for Topics 11, 13, 14, 15, 27, 28 and 30.
- Audited 2018 GS-III and 2021 Prelims routing ledgers.

OCR and official evidence

- Ramesh Singh, *Indian Economy* OCR: technology-mission and agricultural-policy context.
- *Economic Survey 2025-26*, Agriculture and Food Management chapter, p. 277 of the local PDF.
- Union Budget 2026-27 Output-Outcome Monitoring Framework and Expenditure Profile.
- DA&FW operational guidelines: NFSNM; NMEO-OS dated 3 June 2025; PM-RKVY dated 14 November 2024; revised ATMA 2025; MIDH dated 7 May 2026; NBM 2025.
- Official Cabinet/PIB records for TMO, TMC, JTM, NMEO-OP, NMEO-OS, NMNF, pulses, Digital Agriculture Mission and the 2026 cotton mission.
- ICAR material on KVKs, on-farm testing and frontline demonstrations.

Evidence rule: an approved outlay is not expenditure; a target is not achievement; an output is not an outcome; a national trend is not mission-attributable without a counterfactual.

Learning Roadmap

1. Define mission-mode policy, results chains, convergence and gaming risks.
2. Follow technology from ICAR research through KVK/ATMA diffusion to markets.
3. Build dated predecessor-successor maps for food, edible oils, sustainability, horticulture, extension, cotton and jute.
4. Separate current, subsumed, restructured, completed and announced programmes.
5. Evaluate adoption, additionality, outcomes, regional equity, convergence and sunset.

Core Learning Sessions

Core Session 01: Mission-mode policy: definition and boundary

DEFINED BOTTLENECK -> COORDINATED CHAIN -> TIME-BOUND OUTCOME -> REVIEW

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Mission-mode policy is a governance method that organises multiple instruments and institutions around a specified public problem, measurable outcomes, a timetable and feedback.

Answer line: Mission mode is an outcome-and-coordination architecture, not a decorative word in a scheme title.

Keywords: mission-mode; bottleneck; convergence; outcome; feedback

Claim -> named evidence -> analysis -> qualification

- **Claim:** Mission mode is an outcome-and-coordination architecture, not a decorative word in a scheme title.

- **Named evidence:** The 2025-26 Economic Survey describes Krishonnati Yojana as a science-based umbrella linking production, productivity and value realisation.
- **Analysis:** A mission can align research, seed, extension, finance, infrastructure and markets that would otherwise optimise separate departmental outputs.
- **Qualification:** A mission label alone does not prove a time-bound target, dedicated coordination, additional funding or measurable additionality.

Evidence: The 2025-26 Economic Survey describes Krishonnati Yojana as a science-based umbrella linking production, productivity and value realisation.

UPSC trap: Do not classify every programme containing the word Mission as a technology mission.

Mains use: Define the bottleneck and institutional chain before listing schemes.

Recap: Mission mode joins a public problem, coordinated delivery, measurable outcomes and review.

Core Session 02: Mission, scheme and programme

MISSION = outcome architecture | SCHEME = financing/design instrument | PROGRAMME = activity bundle

Visual first: The rail fixes the operating mechanism before the prose.

Definition: A mission supplies direction and convergence; a scheme specifies eligibility, finance and assistance; a programme is a broader set of activities and may contain several schemes.

Answer line: Mission, scheme and programme are overlapping administrative forms, not synonyms.

Keywords: mission; scheme; programme; instrument; architecture

Claim -> named evidence -> analysis -> qualification

- **Claim:** Mission, scheme and programme are overlapping administrative forms, not synonyms.
- **Named evidence:** NFSNM is a mission with seven components, while PM-RKVY is a cafeteria-style umbrella containing several scheme components.
- **Analysis:** Separating the forms prevents a budget line, component guideline and national objective from being treated as the same legal or administrative object.
- **Qualification:** Government usage is not perfectly uniform, so the operative guideline and dated budget document control the classification.

Evidence: NFSNM is a mission with seven components, while PM-RKVY is a cafeteria-style umbrella containing several scheme components.

UPSC trap: Do not infer current legal or budget status from an old name.

Mains use: Use a three-part distinction: objective, instrument and activity bundle.

Recap: Ask what the label does: directs outcomes, finances assistance or groups activities.

Core Session 03: Results chain and theory of change

INPUT -> ACTIVITY -> OUTPUT -> ADOPTION -> OUTCOME -> IMPACT

Visual first: The rail fixes the operating mechanism before the prose.

Definition: A results chain states how money, staff and materials are expected to generate activities, outputs, behavioural adoption, outcomes and long-term public value.

Answer line: Every arrow in a mission results chain is an assumption that must be tested.

Keywords: input; output; adoption; outcome; impact; assumption

Claim -> named evidence -> analysis -> qualification

- **Claim:** Every arrow in a mission results chain is an assumption that must be tested.
- **Named evidence:** The FY 2026-27 Output-Outcome Monitoring Framework separately records cluster area, seed distribution, productivity and production for agricultural missions.

- **Analysis:** The separation reveals why expenditure or kits cannot by themselves establish yield, income, resilience or import substitution.
- **Qualification:** Attribution still requires a counterfactual because rainfall, prices, trade and unrelated technologies change simultaneously.

Evidence: The FY 2026-27 Output-Outcome Monitoring Framework separately records cluster area, seed distribution, productivity and production for agricultural missions.

UPSC trap: Do not call an allocation, training count or covered area an impact.

Mains use: Draw the ladder and identify the weakest unverified arrow.

Recap: A mission is credible only when outputs lead to sustained adoption and attributable outcomes.

Core Session 04: Convergence and time-bound targets

COMMON OUTCOME -> ROLE MATRIX -> SHARED CALENDAR -> JOINT METRICS -> CORRECTION

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Convergence is coordinated responsibility, timing and measurement across agencies for the same outcome, rather than several schemes merely operating in one district.

Answer line: Co-location is not convergence; shared outcomes and accountable sequencing are.

Keywords: convergence; role matrix; milestone; calendar; accountability

Claim -> named evidence -> analysis -> qualification

- **Claim:** Co-location is not convergence; shared outcomes and accountable sequencing are.
- **Named evidence:** NMEO-OS guidelines create national, state and district missions and require convergence with crop insurance, micro-irrigation and agricultural credit.
- **Analysis:** A common calendar can align seed availability, demonstrations, credit, irrigation and processor demand before the crop season.
- **Qualification:** Time-bound targets can distort choices if the target is unsuitable to agro-climate or disconnected from net income.

Evidence: NMEO-OS guidelines create national, state and district missions and require convergence with crop insurance, micro-irrigation and agricultural credit.

UPSC trap: Do not add separate departmental activity totals and call the sum mission success.

Mains use: Name responsible institutions and the sequence in which their actions must occur.

Recap: Strong convergence coordinates roles, timing, data and correction around one bottleneck.

Core Session 05: Fragmentation risk

RESEARCH SILO + SEED SILO + EXTENSION SILO + MARKET SILO = BROKEN DIFFUSION

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Fragmentation occurs when connected stages of innovation are funded, managed and measured separately without responsibility for the final farmer outcome.

Answer line: A strong technology can fail when no institution owns the whole research-to-market chain.

Keywords: fragmentation; silos; ownership; coordination failure; weakest link

Claim -> named evidence -> analysis -> qualification

- **Claim:** A strong technology can fail when no institution owns the whole research-to-market chain.
- **Named evidence:** The historical Cotton Technology Mission used separate but linked mini-missions for research, transfer, marketing and ginning or pressing.
- **Analysis:** Its design recognised that quality seed cannot raise fibre value if extension, market yards and processing remain weak.
- **Qualification:** Multiple mini-missions can themselves fragment unless one authority reconciles targets and timing.

Evidence: The historical Cotton Technology Mission used separate but linked mini-missions for research, transfer, marketing and ginning or pressing.

UPSC trap: Do not assume organisational multiplication automatically creates convergence.

Mains use: Use cotton to show why farm and post-farm stages require one results chain.

Recap: Fragmentation is a governance failure in which no actor is accountable for conversion of technology into value.

Core Session 06: Target gaming and Goodhart risk

TARGET: AREA/KITS/ASSETS -> GAMING RISK -> COMPANION OUTCOME METRIC

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Target gaming occurs when implementing agents maximise a reported indicator rather than the underlying public outcome.

Answer line: When area, kits or demonstrations become the goal, reported achievement can rise while use and welfare stagnate.

Keywords: Goodhart; target gaming; perverse incentive; companion metric; verification

Claim -> named evidence -> analysis -> qualification

- **Claim:** When area, kits or demonstrations become the goal, reported achievement can rise while use and welfare stagnate.
- **Named evidence:** The FY 2026-27 framework itself separates mission outputs from outcome indicators, illustrating the need for paired measures.
- **Analysis:** Area coverage should be paired with continued adoption and agro-climatic fit; machine purchase with utilisation and uptime; demonstrations with independent diffusion.
- **Qualification:** No metric is manipulation-proof, so administrative data need farmer verification and periodic redesign.

Evidence: The FY 2026-27 framework itself separates mission outputs from outcome indicators, illustrating the need for paired measures.

UPSC trap: Do not reward unsuitable area expansion merely because it is easily counted.

Mains use: Pair each physical target with an income, adoption, quality, equity or ecology measure.

Recap: Targets guide delivery only when companion metrics protect the real objective.

Core Session 07: Agricultural technology is broader than machinery

BIOLOGICAL | AGRONOMIC | MECHANICAL | WATER | DIGITAL | POST-HARVEST | INSTITUTIONAL

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Agricultural technology includes varieties, agronomy, machines, resource management, information systems, processing methods and organisational innovations.

Answer line: A seed system, extension protocol or FPO arrangement can be as technological as a machine.

Keywords: biological; agronomic; mechanical; digital; post-harvest; institutional

Claim -> named evidence -> analysis -> qualification

- **Claim:** A seed system, extension protocol or FPO arrangement can be as technological as a machine.
- **Named evidence:** NFSNM supports seeds, INM, IPM, resource-conservation technologies and capacity building, while MIDH combines planting material, protected cultivation and cold-chain infrastructure.
- **Analysis:** Technology changes both the production function and the institutions through which knowledge, inputs and output move.
- **Qualification:** Detailed digital architecture belongs to Topic 27 and sustainable-input design to Topic 14.

Evidence: NFSNM supports seeds, INM, IPM, resource-conservation technologies and capacity building, while MIDH combines planting material, protected cultivation and cold-chain infrastructure.

UPSC trap: Do not reduce technology missions to drones, tractors or laboratory inventions.

Mains use: Classify the technology family and identify its required complements.

Recap: Technology is a usable production or coordination method, not only a physical device.

Core Session 08: Lab-to-land-to-market chain

RESEARCH -> ADAPTIVE TRIAL -> QUALITY MATERIAL -> DEMO -> ADOPTION -> MARKET -> FEEDBACK

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Lab-to-land is the conversion of research into locally validated, available, affordable and repeatedly used farm practice.

Answer line: Publication is not transfer; adoption requires multiplication, trust, finance, service and a remunerative outlet.

Keywords: lab-to-land; adaptive trial; multiplication; diffusion; feedback

Claim -> named evidence -> analysis -> qualification

- **Claim:** Publication is not transfer; adoption requires multiplication, trust, finance, service and a remunerative outlet.
- **Named evidence:** NMEO-OS combines ICAR frontline demonstrations, seed hubs, specialised storage, value-chain clusters and processor linkage.
- **Analysis:** The chain reduces the gap between varietal potential and realised farm returns by coordinating both upstream and downstream conditions.
- **Qualification:** Even a successful demonstration is selected evidence and may not represent risk faced by tenants, rainfed farms or late adopters.

Evidence: NMEO-OS combines ICAR frontline demonstrations, seed hubs, specialised storage, value-chain clusters and processor linkage.

UPSC trap: Do not equate a released variety or demonstration plot with population-wide diffusion.

Mains use: Trace one technology through every stage from research to repeated profitable use.

Recap: Lab-to-land succeeds only when technology survives local adaptation, supply and market tests.

Core Session 09: ICAR and DARE

DARE/ICAR: RESEARCH + VARIETIES + STANDARDS + TECHNICAL VALIDATION

Visual first: The rail fixes the operating mechanism before the prose.

Definition: The Department of Agricultural Research and Education and ICAR organise national agricultural research, coordinate institutes and provide technical evidence for mission design.

Answer line: ICAR creates and validates options; it does not replace state implementation or farmer choice.

Keywords: DARE; ICAR; research system; validation; breeder seed

Claim -> named evidence -> analysis -> qualification

- **Claim:** ICAR creates and validates options; it does not replace state implementation or farmer choice.
- **Named evidence:** NFSNM's national committees include Secretary DARE and DG ICAR; NMEO-OS assigns frontline demonstrations and seed-system roles to ICAR institutions.
- **Analysis:** Research institutions supply varieties, protocols and technical review that missions can scale through state and district systems.
- **Qualification:** Varietal release or trial performance does not prove timely seed supply, affordability or local profitability.

Evidence: NFSNM's national committees include Secretary DARE and DG ICAR; NMEO-OS assigns frontline demonstrations and seed-system roles to ICAR institutions.

UPSC trap: Do not describe ICAR as the sole implementing agency for centrally sponsored farm missions.

Mains use: Place ICAR at research, breeder material, validation and frontline demonstration stages.

Recap: ICAR anchors technical credibility; delivery remains a federal and market process.

Core Session 10: Krishi Vigyan Kendras

OFT -> FRONTLINE DEMONSTRATION -> TRAINING -> DIAGNOSTIC SUPPORT -> FARMER FEEDBACK

Visual first: The rail fixes the operating mechanism before the prose.

Definition: KVKs are district-level frontline extension institutions that test location specificity, demonstrate technologies and build farmer and extension-worker capacity.

Answer line: KVKs translate research into local evidence and send field feedback back to the research system.

Keywords: KVK; on-farm testing; frontline demonstration; capacity development; feedback

Claim -> named evidence -> analysis -> qualification

- **Claim:** KVKs translate research into local evidence and send field feedback back to the research system.
- **Named evidence:** ICAR's KVK mandate includes on-farm testing and frontline demonstrations; NMEO-OS permits KVKs to serve as technical support agencies.
- **Analysis:** On-farm testing asks what works locally, while frontline demonstrations show production potential under supervised field conditions.
- **Qualification:** A KVK demonstration remains an output; independent adoption and multi-season performance are separate outcomes.

Evidence: ICAR's KVK mandate includes on-farm testing and frontline demonstrations; NMEO-OS permits KVKs to serve as technical support agencies.

UPSC trap: Do not confuse KVK frontline extension with the district coordination role of ATMA.

Mains use: Use KVKs as the bridge between research validation and farmer-level learning.

Recap: KVKs test, demonstrate, train and diagnose; they do not guarantee diffusion.

Core Session 11: ATMA and district extension

SREP -> DISTRICT ACTION PLAN -> BLOCK TEAM -> FARMER GROUP -> FEEDBACK

Visual first: The rail fixes the operating mechanism before the prose.

Definition: ATMA is the district-level autonomous institution for managing and coordinating agricultural extension under the extension-reform architecture.

Answer line: ATMA converts district needs and farmer feedback into coordinated extension plans.

Keywords: ATMA; SREP; district extension; farmer advisory committee; convergence

Claim -> named evidence -> analysis -> qualification

- **Claim:** ATMA converts district needs and farmer feedback into coordinated extension plans.
- **Named evidence:** The revised 2025 ATMA guidelines call ATMA the district nodal agency, require Strategic Research and Extension Plans, and link it with KVKs through joint visits and farmer-scientist interaction.
- **Analysis:** Its governing board, management committee, block teams and farmer advisory bodies can align line departments and locally demanded technologies.
- **Qualification:** Administrative autonomy is bounded by staffing, fund release, data quality and state capacity.

Evidence: The revised 2025 ATMA guidelines call ATMA the district nodal agency, require Strategic Research and Extension Plans, and link it with KVKs through joint visits and farmer-scientist interaction.

UPSC trap: Do not treat ATMA as an ICAR research institute or a seed-certification body.

Mains use: Use ATMA for decentralised planning, interdepartmental coordination and last-mile feedback.

Recap: ATMA coordinates extension; KVK supplies frontline technical validation.

Core Session 12: Demonstrations and diffusion

DEMO PLOT -> OBSERVED ADVANTAGE -> TRIAL BY FARMER -> REPEAT USE -> PEER DIFFUSION

Visual first: The rail fixes the operating mechanism before the prose.

Definition: A demonstration is a supervised field display of a technology; diffusion is its wider voluntary spread and continued use.

Answer line: The policy objective is durable adoption, not the number of demonstration events.

Keywords: FLD; CFLD; demonstration; adoption; diffusion

Claim -> named evidence -> analysis -> qualification

- **Claim:** The policy objective is durable adoption, not the number of demonstration events.
- **Named evidence:** NMEO-OS provides for FLDs, cluster frontline demonstrations and state block demonstrations over 2.8 lakh hectares annually.
- **Analysis:** Demonstrations reduce information and trust barriers by making yield, cost and management requirements observable.
- **Qualification:** Selection, supervision and free inputs can make demonstration performance higher than ordinary farm performance.

Evidence: NMEO-OS provides for FLDs, cluster frontline demonstrations and state block demonstrations over 2.8 lakh hectares annually.

UPSC trap: Do not use demonstration yield as an unbiased estimate of mission impact.

Mains use: Compare demo results with independent adoption, repeated use and net-return evidence.

Recap: Demonstration is an information instrument; diffusion is a behavioural outcome.

Core Session 13: Seed chain, SRR and VRR

NUCLEUS -> BREEDER -> FOUNDATION -> CERTIFIED/QUALITY SEED -> FARMER

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Seed Replacement Rate tracks replacement of farm-saved seed with certified or quality seed, while Varietal Replacement Rate concerns movement toward newer varieties.

Answer line: A mission needs both sufficient seed volume and timely varietal renewal.

Keywords: seed chain; SRR; VRR; breeder seed; certified seed

Claim -> named evidence -> analysis -> qualification

- **Claim:** A mission needs both sufficient seed volume and timely varietal renewal.
- **Named evidence:** NFSNM lists enhancement of SRR and VRR among its objectives; NMEO-OS requires five-year seed rolling plans, seed hubs, storage and SATHI tracking.
- **Analysis:** Seed multiplication and storage convert research output into timely planting material at scale.
- **Qualification:** A higher replacement rate does not by itself prove varietal suitability, affordability or yield under local risk.

Evidence: NFSNM lists enhancement of SRR and VRR among its objectives; NMEO-OS requires five-year seed rolling plans, seed hubs, storage and SATHI tracking.

UPSC trap: Do not use SRR and VRR as interchangeable measures.

Mains use: Explain both quantity replacement and quality or varietal renewal.

Recap: Seed-system success combines multiplication, quality assurance, timing and local fit.

Core Session 14: Farmer adoption threshold

EXPECTED NET BENEFIT - COST - LEARNING - RISK - IRREVERSIBILITY > STATUS QUO

Visual first: The rail fixes the operating mechanism before the prose.

Definition: A farmer adopts when the expected risk-adjusted return from a technology exceeds the return from the existing practice and all switching costs.

Answer line: Non-adoption can be rational when downside risk threatens consumption or debt repayment.

Keywords: adoption threshold; switching cost; risk; irreversibility; expected return

Claim -> named evidence -> analysis -> qualification

- **Claim:** Non-adoption can be rational when downside risk threatens consumption or debt repayment.
- **Named evidence:** Oil palm has a perennial gestation period and needs nearby processing, while machinery requires repair services and sufficient utilisation.
- **Analysis:** Credit, insurance, tenure, labour, market demand and demonstration quality change the threshold even when average experimental yield is high.
- **Qualification:** Average profitability can hide distribution of failure risk and different planning horizons for owners and tenants.

Evidence: Oil palm has a perennial gestation period and needs nearby processing, while machinery requires repair services and sufficient utilisation.

UPSC trap: Do not label cautious smallholders as resistant to technology without measuring risk and complements.

Mains use: Write adoption as an economic decision, not an awareness deficit alone.

Recap: Adoption depends on risk-adjusted net value and feasible complements.

Core Session 15: Cluster approach

CONTIGUOUS AREA -> LOWER DELIVERY COST -> AGGREGATION -> BUYER LINK -> SCALE

Visual first: The rail fixes the operating mechanism before the prose.

Definition: A cluster concentrates production and services so extension, machinery, aggregation, testing and procurement can operate at lower unit cost.

Answer line: Clusters create economies of coordination but can also create exclusion and crop lock-in.

Keywords: cluster; economies of scale; aggregation; selection; monopsony

Claim -> named evidence -> analysis -> qualification

- **Claim:** Clusters create economies of coordination but can also create exclusion and crop lock-in.
- **Named evidence:** NMEO-OS plans over 600 value-chain clusters covering about 10 lakh hectares annually; MIDH requires crop-specific cluster planning.
- **Analysis:** Contiguity can support common demonstrations, seed logistics, assaying and processor procurement.
- **Qualification:** Politically selected clusters may exclude isolated, tribal, tenant or rainfed farmers and strengthen a single buyer.

Evidence: NMEO-OS plans over 600 value-chain clusters covering about 10 lakh hectares annually; MIDH requires crop-specific cluster planning.

UPSC trap: Do not assume a cluster is equitable merely because it is efficient.

Mains use: Pair cluster scale with transparent entry, FPO bargaining and ecological safeguards.

Recap: Clusters reduce coordination cost only when access and buyer competition are protected.

Core Session 16: Value-chain complementarity

PRODUCTIVITY -> QUALITY -> AGGREGATION -> PROCESSING -> MARKET -> PRICE REALISATION

Visual first: The rail fixes the operating mechanism before the prose.

Definition: A value-chain mission connects farm technology with grading, storage, processing, logistics and demand.

Answer line: Production becomes income only when quality and market links convert output into net value.

Keywords: value chain; quality; processing; aggregation; price realisation

Claim -> named evidence -> analysis -> qualification

- **Claim:** Production becomes income only when quality and market links convert output into net value.
- **Named evidence:** MIDH's 2026 guidelines require an end-to-end approach, while the historical cotton and jute missions linked farm technology with marketing and processing.
- **Analysis:** Downstream capacity prevents gluts, loss and quality discounts from neutralising production gains.
- **Qualification:** Processor proximity can create monopsony, and infrastructure can remain idle if crop volumes or standards are misjudged.

Evidence: MIDH's 2026 guidelines require an end-to-end approach, while the historical cotton and jute missions linked farm technology with marketing and processing.

UPSC trap: Do not treat production growth as automatic farm-income growth.

Mains use: After every production claim, test cost, loss, quality, bargaining and price.

Recap: Mission value is realised when farm output reaches a competitive market in usable form.

Core Session 17: Monitoring architecture

BASELINE -> MILESTONE -> DASHBOARD -> FARMER CHECK -> MID-COURSE CORRECTION

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Monitoring tracks implementation against a baseline and timetable; evaluation asks whether the mission caused worthwhile outcomes.

Answer line: Dashboards support control, but farmer verification and independent evaluation protect truth.

Keywords: baseline; dashboard; milestone; verification; correction

Claim -> named evidence -> analysis -> qualification

- **Claim:** Dashboards support control, but farmer verification and independent evaluation protect truth.
- **Named evidence:** NMEO-OS creates governing and steering bodies with digital tracking; MIDH uses the SURAKSHA portal and monthly state reporting.
- **Analysis:** Timely monitoring can identify delayed seed supply, unspent funds, missing processors or regional underperformance within the crop cycle.
- **Qualification:** Portal completeness can improve while field quality, exclusion or data incentives remain weak.

Evidence: NMEO-OS creates governing and steering bodies with digital tracking; MIDH uses the SURAKSHA portal and monthly state reporting.

UPSC trap: Do not mistake real-time reporting for real-time welfare.

Mains use: Separate implementation monitoring from causal impact evaluation.

Recap: Monitoring asks whether delivery happened; evaluation asks what difference it made.

Core Session 18: Additionality and counterfactual

OBSERVED CHANGE - PLAUSIBLE CHANGE WITHOUT MISSION = ADDITIONALITY

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Additionality is the outcome attributable to the mission beyond what would have occurred without it.

Answer line: Before-after growth is not attribution because weather, prices, area and other policies also move.

Keywords: additionality; counterfactual; attribution; baseline; comparison

Claim -> named evidence -> analysis -> qualification

- **Claim:** Before-after growth is not attribution because weather, prices, area and other policies also move.
- **Named evidence:** Official reports show major oilseed and pulse production growth over long periods, but the same periods include price, rainfall, trade and technology changes.
- **Analysis:** Matched comparison, phased rollout, credible quasi-experiments and multi-season panels improve causal inference.
- **Qualification:** Randomised designs are not always feasible for national programmes, so triangulation and transparent assumptions are necessary.

Evidence: Official reports show major oilseed and pulse production growth over long periods, but the same periods include price, rainfall, trade and technology changes.

UPSC trap: Do not credit the entire national production change to one mission.

Mains use: State the observed result, alternative causes and the evaluation design needed.

Recap: Mission success is incremental, not identical to the national trend.

Core Session 19: Regional equity

NATIONAL AVERAGE -> STATE/DISTRICT/FARM-TYPE DISTRIBUTION -> EQUITY VERDICT

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Regional equity asks whether mission benefits reach low-productivity, rainfed, tribal and weak-capacity regions rather than only already connected clusters.

Answer line: A rising national average can coexist with widening regional gaps.

Keywords: regional equity; rainfed; tribal; baseline; state capacity

Claim -> named evidence -> analysis -> qualification

- **Claim:** A rising national average can coexist with widening regional gaps.
- **Named evidence:** NFSNM prioritises low-productivity high-potential districts and rainfed foodgrain areas; MIDH uses regionally differentiated strategies and higher support patterns for North-East and Himalayan states.
- **Analysis:** Targeting lagging regions can raise additionality but requires stronger extension, logistics and local adaptation.
- **Qualification:** Uniform national physical targets may penalise ecologically unsuitable or institutionally weaker regions.

Evidence: NFSNM prioritises low-productivity high-potential districts and rainfed foodgrain areas; MIDH uses regionally differentiated strategies and higher support patterns for North-East and Himalayan states.

UPSC trap: Do not infer equitable success from all-India production alone.

Mains use: Disaggregate outcomes by state, farm size, irrigation, gender, tenancy and social group.

Recap: Equity is distribution of durable outcomes, not equal activity counts.

Core Session 20: Sunset, mainstreaming and successor rules

MISSION END -> SCALE | MAINSTREAM | REDESIGN | CLOSE

Visual first: The rail fixes the operating mechanism before the prose.

Definition: A sunset rule specifies when temporary mission support ends, becomes routine administration, is redesigned or is closed.

Answer line: Mission mode loses discipline when every temporary intervention continues indefinitely without a fresh problem test.

Keywords: sunset; mainstreaming; successor; redesign; closure

Claim -> named evidence -> analysis -> qualification

- **Claim:** Mission mode loses discipline when every temporary intervention continues indefinitely without a fresh problem test.
- **Named evidence:** Oilseed programmes moved from TMO to ISOPOM, NMOOP and current NMEO missions; SMSP moved from NMAET into NFSNM.
- **Analysis:** Successor design can retain useful capability while replacing obsolete targets and fragmented structures.
- **Qualification:** Renaming alone does not prove reform, and closure can destroy useful public capacity if transition is unmanaged.

Evidence: Oilseed programmes moved from TMO to ISOPOM, NMOOP and current NMEO missions; SMSP moved from NMAET into NFSNM.

UPSC trap: Do not present a predecessor and successor as simultaneously current.

Mains use: End evaluations with an explicit scale, mainstream, redesign or close decision.

Recap: A mission should have an exit logic as clear as its launch logic.

Core Session 21: Technology Mission on Oilseeds: origin

MAY 1986 TMO -> RESEARCH + SEED + EXTENSION + PRICE/MARKET SUPPORT

Visual first: The rail fixes the operating mechanism before the prose.

Definition: The Technology Mission on Oilseeds was launched in May 1986 to address low productivity, edible-oil dependence and fragmented support.

Answer line: TMO is the classic Indian example of a commodity problem organised as a coordinated mission.

Keywords: TMO; 1986; oilseeds; Yellow Revolution; import dependence

Claim -> named evidence -> analysis -> qualification

- **Claim:** TMO is the classic Indian example of a commodity problem organised as a coordinated mission.
- **Named evidence:** Official Agriculture Ministry history dates TMO to May 1986; PIB reported oilseed output of 112.70 lakh tonnes in 1986-87.
- **Analysis:** The mission aligned technology generation, input delivery, extension and supportive market policy rather than relying on one seed or subsidy.
- **Qualification:** Later production growth cannot be attributed solely to TMO, and temporary self-sufficiency did not eliminate structural import dependence.

Evidence: Official Agriculture Ministry history dates TMO to May 1986; PIB reported oilseed output of 112.70 lakh tonnes in 1986-87.

UPSC trap: Do not call TMO or its original umbrella a current scheme.

Mains use: Use TMO to introduce mission-mode coordination and then trace successor architecture.

Recap: TMO began the oilseed mission lineage but belongs to a dated historical phase.

Core Session 22: TMO results and qualification

OUTPUT GROWTH -> TEMPORARY SELF-SUFFICIENCY -> COMPETING CROPS/IMPORTS -> RENEWED GAP

Visual first: The rail fixes the operating mechanism before the prose.

Definition: TMO contributed to higher oilseed capability, but sustained edible-oil security depends on productivity, prices, demand and trade.

Answer line: Historical success must be judged as additional capability, not permanent closure of the problem.

Keywords: production; self-sufficiency; productivity; trade; durability

Claim -> named evidence -> analysis -> qualification

- **Claim:** Historical success must be judged as additional capability, not permanent closure of the problem.
- **Named evidence:** PIB reported oilseed production rising from 112.70 lakh tonnes in 1986-87 to 324.80 lakh tonnes in 2010-11.
- **Analysis:** The long-run increase shows capability expansion but also spans changing area, prices, weather, varieties and successor programmes.
- **Qualification:** A production series does not measure farmer income, oil recovery, consumer cost or mission-only causation.

Evidence: PIB reported oilseed production rising from 112.70 lakh tonnes in 1986-87 to 324.80 lakh tonnes in 2010-11.

UPSC trap: Do not convert a historical production rise into proof of current edible-oil self-reliance.

Mains use: Pair the achievement with continuing import dependence and a causal caveat.

Recap: TMO produced capability gains, but durable security requires continuing yield and value-chain reform.

Core Session 23: Oilseed successor chronology

TMO 1986 -> ISOPOM 2004 -> NMOOP 2014-15 -> NFSM-OS -> NMEO-OP/NMEO-OS

Visual first: The rail fixes the operating mechanism before the prose.

Definition: India's edible-oil policy repeatedly reorganised crop coverage and administrative umbrellas as bottlenecks changed.

Answer line: Chronology prevents a historical mission name from being mistaken for a current programme.

Keywords: ISOPOM; NMOOP; NFSM-OS; predecessor; successor

Claim -> named evidence -> analysis -> qualification

- **Claim:** Chronology prevents a historical mission name from being mistaken for a current programme.
- **Named evidence:** Official guidelines record TMO's subsumption into ISOPOM in 2004, NMOOP from 2014-15, later NFSM oilseed components and current NMEO missions.
- **Analysis:** Restructuring moved from a broad integrated crop scheme to separate annual-oilseed and perennial-oil-palm architectures.
- **Qualification:** The sequence is not a clean causal experiment; overlaps, liabilities and administrative transitions can persist.

Evidence: Official guidelines record TMO's subsumption into ISOPOM in 2004, NMOOP from 2014-15, later NFSM oilseed components and current NMEO missions.

UPSC trap: Do not merge TMO, NMOOP, NFSM-OS, NMEO-OS and NMEO-OP into one timeless mission.

Mains use: Write the predecessor-successor arrow with dates before describing current components.

Recap: Oilseed policy evolved through changing umbrellas; only the dated current mission should carry current targets.

Core Session 24: NMEO-OS: current approved mission

2024-25--2030-31 | OUTLAY RS 10,103.38 CR | NFSM-OS SUBSUMED

Visual first: The rail fixes the operating mechanism before the prose.

Definition: NMEO-OS is the current centrally sponsored annual-oilseed mission under Krishonnati Yojana, sanctioned for 2024-25 to 2030-31.

Answer line: NMEO-OS is distinct from oil palm and expressly subsumes the former NFSM-Oilseeds component.

Keywords: NMEO-OS; annual oilseeds; Centrally Sponsored Scheme; outlay; subsumption

Claim -> named evidence -> analysis -> qualification

- **Claim:** NMEO-OS is distinct from oil palm and expressly subsumes the former NFSM-Oilseeds component.
- **Named evidence:** The 3 June 2025 operational guidelines state an outlay of Rs 10,103.38 crore, including a central share of Rs 7,481.67 crore.
- **Analysis:** Its focus on rapeseed-mustard, groundnut and soybean, with secondary and tree-borne oils, combines seed, demonstrations, clusters and processing.
- **Qualification:** Approved outlay is neither expenditure nor achievement, and the mission period extends beyond the current cutoff.

Evidence: The 3 June 2025 operational guidelines state an outlay of Rs 10,103.38 crore, including a central share of Rs 7,481.67 crore.

UPSC trap: Do not write NMEO-OS as a renamed oil-palm scheme.

Mains use: State period, legal form, crops and predecessor before quoting targets.

Recap: NMEO-OS is the current annual-oilseed mission; approval and outcome remain separate facts.

Core Session 25: NMEO-OS: targets and delivery

600+ VCCs | 10 LAKH HA/YR | 2.8 LAKH HA DEMOS/YR | 65 HUBS | 50 STORES

Visual first: The rail fixes the operating mechanism before the prose.

Definition: NMEO-OS uses value-chain clusters, seed-system expansion, demonstrations, fallow-area targeting and processor linkage to reduce yield and market gaps.

Answer line: Its design combines technology diffusion with seed logistics and downstream demand.

Keywords: value-chain cluster; seed hub; SATHI; fallow area; processor linkage

Claim -> named evidence -> analysis -> qualification

- **Claim:** Its design combines technology diffusion with seed logistics and downstream demand.
- **Named evidence:** Official guidelines specify over 600 clusters covering about 10 lakh hectares annually, demonstrations over 2.8 lakh hectares annually, 65 seed hubs and 50 specialised storage units.
- **Analysis:** Five-year rolling seed plans and SATHI tracking aim to make recent varieties available at the correct place and season.
- **Qualification:** The Cabinet target of 69.7 million tonnes of primary oilseeds by 2030-31 is a target, not a forecast or achieved output.

Evidence: Official guidelines specify over 600 clusters covering about 10 lakh hectares annually, demonstrations over 2.8 lakh hectares annually, 65 seed hubs and 50 specialised storage units.

UPSC trap: Do not add cluster area and demonstration area as if they were distinct farmers or net additional land.

Mains use: Use the targets to explain mechanism, then test yield, net returns and import outcomes.

Recap: NMEO-OS links seed renewal, local diffusion and value-chain coordination at scale.

Core Session 26: NMEO-OP: approved phase and 2026-27 status

2021-22--2025-26 PHASE -> FY 2026-27 OOMF TARGETS -> EXTENSION ORDER NOT LOCATED

Visual first: The rail fixes the operating mechanism before the prose.

Definition: NMEO-OP is the oil-palm mission whose original Cabinet-approved funding phase ran from 2021-22 to 2025-26.

Answer line: Administrative tenure, later budget targets and a formal extension order must be reported separately.

Keywords: NMEO-OP; oil palm; approved phase; OOMF; status caution

Claim -> named evidence -> analysis -> qualification

- **Claim:** Administrative tenure, later budget targets and a formal extension order must be reported separately.
- **Named evidence:** The 2021 approval carried Rs 11,040 crore and aimed at 6.5 lakh hectares of additional area; the FY 2026-27 Outcome Budget still sets one lakh hectare annual expansion and 23.30 lakh tonnes CPO production as targets.
- **Analysis:** The 2026-27 target table evidences budgeted monitoring beyond the original phase.
- **Qualification:** No separate post-2025-26 extension or successor approval was located by 10 September 2026, so the OOMF must not be described as that order.

Evidence: The 2021 approval carried Rs 11,040 crore and aimed at 6.5 lakh hectares of additional area; the FY 2026-27 Outcome Budget still sets one lakh hectare annual expansion and 23.30 lakh tonnes CPO production as targets.

UPSC trap: Do not confuse a 2029-30 production aspiration with formal mission tenure.

Mains use: Write both the ended approved phase and the dated 2026-27 budget target.

Recap: NMEO-OP has continuing budget targets, but its formal post-phase authority needs the missing extension document.

Core Session 27: Oil-palm technology and ecology

QUALITY SEEDLING -> 4-YEAR GESTATION -> HARVEST -> NEARBY MILL -> CPO

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Oil palm is a perennial plantation crop whose economics depend on planting material, gestation support, frequent harvest and rapid processing.

Answer line: High oil yield per hectare does not remove location, water, biodiversity and processor-dependence risks.

Keywords: perennial; gestation; FFB; processing radius; ecological suitability

Claim -> named evidence -> analysis -> qualification

- **Claim:** High oil yield per hectare does not remove location, water, biodiversity and processor-dependence risks.
- **Named evidence:** NMEO-OP assistance includes planting material, gestation-period support, irrigation and price-related viability arrangements.
- **Analysis:** Fresh fruit bunches require timely processing, so farm adoption and mill location are mutually dependent investments.
- **Qualification:** National yield comparisons can conceal basin water stress, land-use change and smallholder bargaining risk.

Evidence: NMEO-OP assistance includes planting material, gestation-period support, irrigation and price-related viability arrangements.

UPSC trap: Do not infer ecological suitability from high biological oil yield alone.

Mains use: Evaluate oil palm with water budget, land-use baseline, processor competition and long-term price risk.

Recap: Oil-palm success is a location-specific farm-and-processing system, not simple area expansion.

Core Session 28: NFSM origin and original targets

OCT 2007: RICE +10 MT | WHEAT +8 MT | PULSES +2 MT BY 2011-12

Visual first: The rail fixes the operating mechanism before the prose.

Definition: NFSM began in October 2007 as a centrally sponsored mission for additional rice, wheat and pulse production by the end of the Eleventh Plan.

Answer line: Its origin illustrates a time-bound crop-production mission with explicit national targets.

Keywords: NFSM; October 2007; rice; wheat; pulses

Claim -> named evidence -> analysis -> qualification

- **Claim:** Its origin illustrates a time-bound crop-production mission with explicit national targets.
- **Named evidence:** Current NFSM guidelines reproduce the original targets of 10 million tonnes rice, 8 million tonnes wheat and 2 million tonnes pulses.
- **Analysis:** Cluster demonstrations, improved varieties, integrated crop management and capacity building sought to close yield gaps.
- **Qualification:** The original targets belong to 2011-12 and must not be quoted as current objectives.

Evidence: Current NFSM guidelines reproduce the original targets of 10 million tonnes rice, 8 million tonnes wheat and 2 million tonnes pulses.

UPSC trap: Do not apply the 2007 crop basket or targets to FY 2026-27.

Mains use: Use origin targets only to explain the initial mission problem and design.

Recap: NFSM began with three crops and dated Eleventh Plan production targets.

Core Session 29: NFSNM: current components and status

RICE | WHEAT | PULSES | MAIZE/BARLEY | SHREE ANNA | COMMERCIAL CROPS | SEEDS

Visual first: The rail fixes the operating mechanism before the prose.

Definition: NFSM was renamed National Food Security and Nutrition Mission and now integrates seven crop and seed components.

Answer line: The current basket is wider than the 2007 mission and includes the former seed sub-mission.

Keywords: NFSNM; seven components; nutrition; commercial crops; seed component

Claim -> named evidence -> analysis -> qualification

- **Claim:** The current basket is wider than the 2007 mission and includes the former seed sub-mission.
- **Named evidence:** Official guidelines list rice, wheat, pulses, coarse cereals, Sub-Mission on Nutri-Cereals, commercial crops and seed components; FY 2026-27 OOMF retains NFSNM under Krishonnati Yojana.
- **Analysis:** The mission now links sustainable productivity, soil fertility, farmer income, farm-gate value addition, SRR and VRR.
- **Qualification:** The guideline's earlier continuation approval ended 31 March 2026, but the later FY 2026-27 OOMF supplies the current budget-status evidence.

Evidence: Official guidelines list rice, wheat, pulses, coarse cereals, Sub-Mission on Nutri-Cereals, commercial crops and seed components; FY 2026-27 OOMF retains NFSNM under Krishonnati Yojana.

UPSC trap: Do not call oilseeds or oil palm current NFSNM components after their subsumption under NMEO missions.

Mains use: Date the seven-component list and distinguish guideline tenure from 2026-27 budget continuation.

Recap: NFSNM is current in FY 2026-27 with a seven-component crop-and-seed architecture.

Core Session 30: NFSNM technology focus and targets

LOW-PRODUCTIVITY DISTRICT -> CLUSTER DEMO -> NEW SEED -> INM/IPM -> WATER SAVING

Visual first: The rail fixes the operating mechanism before the prose.

Definition: NFSNM raises sustainable crop productivity through agro-climatic planning, cropping-system interventions, seed renewal and integrated management.

Answer line: Its technology focus is a package, not a single high-yielding variety.

Keywords: cluster demonstration; INM; IPM; resource conservation; biofortification

Claim -> named evidence -> analysis -> qualification

- **Claim:** Its technology focus is a package, not a single high-yielding variety.
- **Named evidence:** The FY 2026-27 OOMF targets cereal productivity of 3,123 kg/ha, nutri-cereal productivity of 1,494 kg/ha and coarse-cereal productivity of 3,797 kg/ha.
- **Analysis:** Newly released climate-resilient, biofortified and pest-resistant seed enters the mission alongside nutrient, pest and water-use practices.
- **Qualification:** Outcome-budget targets are planned values and do not establish realised yield or mission causation.

Evidence: The FY 2026-27 OOMF targets cereal productivity of 3,123 kg/ha, nutri-cereal productivity of 1,494 kg/ha and coarse-cereal productivity of 3,797 kg/ha.

UPSC trap: Do not confuse aggregate cereal productivity with every crop or district.

Mains use: Quote one dated target and then explain package technology and regional variation.

Recap: NFSNM combines seed, agronomy and capacity building around dated productivity outcomes.

Core Session 31: Mission for Aatmanirbharta in Pulses

2025-26--2030-31 | RS 11,440 CR | SEED + AREA + PRODUCTIVITY + PROCUREMENT

Visual first: The rail fixes the operating mechanism before the prose.

Definition: The current pulses mission is a six-year mission approved in 2025 to raise domestic pulse capability and reduce import vulnerability.

Answer line: It is distinct from the pulses component of NFSNM even though the two policy systems must converge.

Keywords: pulses; self-reliance; procurement; seed; 2030-31

Claim -> named evidence -> analysis -> qualification

- **Claim:** It is distinct from the pulses component of NFSNM even though the two policy systems must converge.
- **Named evidence:** The Cabinet-approved mission carries Rs 11,440 crore for 2025-26 to 2030-31 and targets 350 lakh tonnes production, 310 lakh hectares area and 1,130 kg/ha productivity by 2030-31.
- **Analysis:** The design combines climate-resilient seed, area expansion, productivity, processing and procurement support for tur, urad and masoor.
- **Qualification:** Targets are not achievements, and assured procurement remains subject to registration, quality, operational rules and market implementation.

Evidence: The Cabinet-approved mission carries Rs 11,440 crore for 2025-26 to 2030-31 and targets 350 lakh tonnes production, 310 lakh hectares area and 1,130 kg/ha productivity by 2030-31.

UPSC trap: Do not merge the standalone 2025 pulses mission with the historical NFSM pulses component.

Mains use: Explain convergence but retain separate approval, outlay, period and targets.

Recap: The pulses mission adds a dedicated value-chain and procurement push to the continuing NFSNM crop platform.

Core Session 32: Millets and Nutri-Cereals status

INSIMP 2011-14 -> NFSM COARSE CEREALS 2014-18 -> NFSNM SUB-MISSION ON SHREE ANNA

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Millet support currently operates as the Sub-Mission on Nutri-Cereals within NFSNM rather than a separately verified current National Millet Mission.

Answer line: Use the official current component name, not a generic mission label.

Keywords: Shree Anna; nutri-cereals; INSIMP; sub-mission; status

Claim -> named evidence -> analysis -> qualification

- **Claim:** Use the official current component name, not a generic mission label.
- **Named evidence:** NFSNM guidelines trace INSIMP under RKVY, merger into NFSM-Coarse Cereals and a separate nutri-cereal sub-mission from 2018-19.
- **Analysis:** The current component supports traditionally grown and consumed jowar, bajra, ragi and small millets through seed and production interventions.
- **Qualification:** International Year of Millets publicity or a state millet mission does not establish a current standalone Union mission.

Evidence: NFSNM guidelines trace INSIMP under RKVY, merger into NFSM-Coarse Cereals and a separate nutri-cereal sub-mission from 2018-19.

UPSC trap: Do not invent a current National Millet Mission without an operative Union guideline.

Mains use: State that millets are mission-labelled through the NFSNM sub-mission.

Recap: Current Union millet support sits inside NFSNM's Sub-Mission on Nutri-Cereals.

Core Session 33: NMSA origin and climate-policy role

NAPCC -> NMSA 2014-15 -> RESILIENCE + RAINFED SYSTEMS + RESOURCE CONSERVATION

Visual first: The rail fixes the operating mechanism before the prose.

Definition: National Mission for Sustainable Agriculture is the agricultural mission under the National Action Plan on Climate Change.

Answer line: NMSA makes resilience and resource conservation explicit mission outcomes.

Keywords: NMSA; NAPCC; resilience; rainfed; integrated farming

Claim -> named evidence -> analysis -> qualification

- **Claim:** NMSA makes resilience and resource conservation explicit mission outcomes.
- **Named evidence:** Official NMSA materials identify Rainfed Area Development, On-Farm Water Management and Soil Health Management as original components.
- **Analysis:** RAD promotes integrated farming systems to diversify income and risk in rainfed areas.
- **Qualification:** The original component bundle has since been redistributed across newer umbrellas, so old lists are historical snapshots.

Evidence: Official NMSA materials identify Rainfed Area Development, On-Farm Water Management and Soil Health Management as original components.

UPSC trap: Do not present every original NMSA component as still administered under one unchanged mission.

Mains use: Use NMSA for the climate-resilience logic, then give the current delivery placement.

Recap: NMSA supplies the climate mission; current implementation is spread across rationalised components.

Core Session 34: NMSA restructuring under PM-RKVY

NMSA FUNCTIONS -> RAD + PDMC + SH&F + PKVY + AGROFORESTRY IN PM-RKVY

Visual first: The rail fixes the operating mechanism before the prose.

Definition: The 2024 PM-RKVY restructuring placed major sustainability and mechanisation components in a state-flexible cafeteria scheme.

Answer line: Mission purpose can continue even when its administrative components move.

Keywords: PM-RKVY; cafeteria; RAD; PDMC; soil health; agroforestry

Claim -> named evidence -> analysis -> qualification

- **Claim:** Mission purpose can continue even when its administrative components move.
- **Named evidence:** PM-RKVY guidelines dated 14 November 2024 list PDMC, SMAM, Soil Health and Fertility, PKVY, RAD, Agroforestry and Crop Diversification among current components.
- **Analysis:** State flexibility can align portfolios with local agro-climate and farmer needs while reducing duplicate schemes.
- **Qualification:** Flexibility can also weaken comparability or divert funds unless outcome guardrails and ring-fenced functions remain.

Evidence: PM-RKVY guidelines dated 14 November 2024 list PDMC, SMAM, Soil Health and Fertility, PKVY, RAD, Agroforestry and Crop Diversification among current components.

UPSC trap: Do not equate NMSA's conceptual mission with the current PM-RKVY budget umbrella.

Mains use: Distinguish climate-policy ownership from present implementation location.

Recap: NMSA's objectives persist through a rationalised PM-RKVY delivery architecture.

Core Session 35: National Mission on Natural Farming

25 NOV 2024 APPROVAL -> RS 2,481 CR TO MAR 2026 -> PROPOSED NEXT PHASE

Visual first: The rail fixes the operating mechanism before the prose.

Definition: NMNF was approved in November 2024 as a standalone centrally sponsored mission for location-specific natural-farming systems.

Answer line: Its first approved phase and its proposed post-March-2026 phase must not be merged.

Keywords: NMNF; natural farming; BRC; cluster; approval status

Claim -> named evidence -> analysis -> qualification

- **Claim:** Its first approved phase and its proposed post-March-2026 phase must not be merged.
- **Named evidence:** The first phase had Rs 2,481 crore, 15,000 clusters, 7.5 lakh hectares, one crore farmers, 10,000 bio-input centres and 2,000 model farms through March 2026.
- **Analysis:** The FY 2026-27 OOMF provides Rs 750 crore and proposed targets, but expressly says the 2026-27 to 2030-31 targets are tentative and subject to approval; the draft EFC proposes 65,000 clusters over 32.5 lakh hectares.
- **Qualification:** A budget provision and draft EFC are not the competent authority's final extension approval.

Evidence: The first phase had Rs 2,481 crore, 15,000 clusters, 7.5 lakh hectares, one crore farmers, 10,000 bio-input centres and 2,000 model farms through March 2026.

UPSC trap: Do not state the proposed second phase as finally approved.

Mains use: Write first-phase achievement separately from the conditional FY 2026-27 proposal.

Recap: NMNF is mission-labelled, but its post-March-2026 scale-up remained approval-qualified at the cutoff.

Core Session 36: NHM to MIDH evolution

NHM 2005-06 -> MIDH 2014-15 -> 2026 UPDATED GUIDELINES

Visual first: The rail fixes the operating mechanism before the prose.

Definition: National Horticulture Mission began in 2005-06 and became a sub-scheme within the broader MIDH architecture from 2014-15.

Answer line: NHM and MIDH are not interchangeable names across all years.

Keywords: NHM; MIDH; horticulture; predecessor; umbrella

Claim -> named evidence -> analysis -> qualification

- **Claim:** NHM and MIDH are not interchangeable names across all years.
- **Named evidence:** MIDH's operational guidelines updated on 7 May 2026 retain NHM as one of six sub-schemes.
- **Analysis:** The wider umbrella joins region-specific production, quality planting material, protected cultivation, post-harvest management and marketing.
- **Qualification:** A successor umbrella does not prove that every income bottleneck or regional gap has been solved.

Evidence: MIDH's operational guidelines updated on 7 May 2026 retain NHM as one of six sub-schemes.

UPSC trap: Do not describe NHM as abolished merely because it became a MIDH component.

Mains use: Use the arrow NHM to MIDH and then state NHM's current component status.

Recap: NHM survives as a MIDH sub-scheme inside a broader production-to-market mission.

Core Session 37: MIDH current architecture

NHM | HMNEH | NHB | CDB | NBM | CIH

Visual first: The rail fixes the operating mechanism before the prose.

Definition: MIDH is the current centrally sponsored horticulture mission covering production, post-harvest, processing and marketing through six sub-schemes.

Answer line: The 2026 component list is a dated administrative fact.

Keywords: MIDH; NHM; HMNEH; NHB; CDB; CIH

Claim -> named evidence -> analysis -> qualification

- **Claim:** The 2026 component list is a dated administrative fact.
- **Named evidence:** The 7 May 2026 guidelines list NHM, HMNEH, National Horticulture Board, Coconut Development Board, National Bamboo Mission and Central Institute for Horticulture.
- **Analysis:** Its funding pattern is generally 60:40, 90:10 for North-East and Himalayan states, and 100% Union funding for specified boards, agencies and UTs without legislature.
- **Qualification:** Funding ratios do not measure state absorption, project quality or farmer incidence.

Evidence: The 7 May 2026 guidelines list NHM, HMNEH, National Horticulture Board, Coconut Development Board, National Bamboo Mission and Central Institute for Horticulture.

UPSC trap: Do not omit the boards and CIH when asked for the current MIDH architecture.

Mains use: Present the six-part structure and the production-to-market logic.

Recap: MIDH combines regional missions, national boards and technical support under one horticulture umbrella.

Core Session 38: MIDH targets and farmer income

PLANTING MATERIAL -> PRODUCTIVITY -> LOSS REDUCTION -> MARKET -> NET INCOME

Visual first: The rail fixes the operating mechanism before the prose.

Definition: MIDH can raise horticulture output and quality, but farmer income depends on cost, perishability, processing, bargaining and price.

Answer line: Horticulture mission success is value realisation, not tonnes alone.

Keywords: planting material; protected cultivation; cold chain; perishability; net income

Claim -> named evidence -> analysis -> qualification

- **Claim:** Horticulture mission success is value realisation, not tonnes alone.
- **Named evidence:** FY 2026-27 OOMF targets include 50 new nurseries, 80,000 hectares of new gardens, 15,000 hectares protected cultivation and 1.7 lakh tonnes additional cold-storage capacity.
- **Analysis:** These outputs can support the mission's 365 million tonne horticulture-production outcome target by easing biological and post-harvest constraints.
- **Qualification:** All are targets; gluts, quality standards, energy cost and unequal aggregation can still reduce net returns.

Evidence: FY 2026-27 OOMF targets include 50 new nurseries, 80,000 hectares of new gardens, 15,000 hectares protected cultivation and 1.7 lakh tonnes additional cold-storage capacity.

UPSC trap: Do not answer the 2018 NHM PYQ with production statistics alone.

Mains use: Connect each intervention to net price realisation and name the remaining bottleneck.

Recap: MIDH raises capability; income rises only when technology and markets convert output into stable net value.

Core Session 39: National Bamboo Mission

2006-07 LAUNCH -> MIDH 2014-15 -> RESTRUCTURED 2018 -> 2025 GUIDELINES

Visual first: The rail fixes the operating mechanism before the prose.

Definition: National Bamboo Mission is a current MIDH sub-scheme for quality planting material, cultivation and bamboo value-chain development.

Answer line: Bamboo is mission-labelled and current, but its administrative form changed over time.

Keywords: NBM; bamboo; restructured; MIDH; value chain

Claim -> named evidence -> analysis -> qualification

- **Claim:** Bamboo is mission-labelled and current, but its administrative form changed over time.
- **Named evidence:** The 2025 NBM guidelines cover nurseries, non-forest plantations, primary processing, aggregation, markets, skills and technology support.
- **Analysis:** The mission links a long-gestation biological resource with processing, design and market demand.
- **Qualification:** Plantation targets can create delayed supply or ecological and market mismatch if species, tenure and industry demand are weak.

Evidence: The 2025 NBM guidelines cover nurseries, non-forest plantations, primary processing, aggregation, markets, skills and technology support.

UPSC trap: Do not treat bamboo plantation area as immediate industrial output or farmer income.

Mains use: Trace planting material to harvest, processing, product demand and payment.

Recap: Current NBM is a MIDH value-chain mission, not merely a plantation subsidy.

Core Session 40: National Beekeeping and Honey Mission status

2020-21--2022-23 -> EXTENDED TO 2025-26 -> NO LATER EXTENSION LOCATED

Visual first: The rail fixes the operating mechanism before the prose.

Definition: NBHM was a central-sector mission for scientific beekeeping, pollination, processing, testing, traceability and markets.

Answer line: At the cutoff, it is a recently completed approved phase, not safely a current post-2025-26 mission.

Keywords: NBHM; pollination; honey; traceability; completed phase

Claim -> named evidence -> analysis -> qualification

- **Claim:** At the cutoff, it is a recently completed approved phase, not safely a current post-2025-26 mission.
- **Named evidence:** The original Rs 500 crore mission was extended through 2025-26 using the remaining Rs 370 crore; official releases located no extension beyond that year by 10 September 2026.
- **Analysis:** Its three-mini-mission architecture linked production, post-harvest or markets, and research or technology.
- **Qualification:** Ongoing assets, portals or projects after the funding period do not by themselves extend the scheme.

Evidence: The original Rs 500 crore mission was extended through 2025-26 using the remaining Rs 370 crore; official releases located no extension beyond that year by 10 September 2026.

UPSC trap: Do not call NBHM current in FY 2026-27 without a fresh approval.

Mains use: Label it 'approved phase ended 2025-26; successor or extension not located'.

Recap: NBHM remains an important model, but its current administrative continuation is unverified.

Core Session 41: NMAET: classic four-sub-mission architecture

SMAE + SMSP + SMAM + SMPPQ

Visual first: The rail fixes the operating mechanism before the prose.

Definition: NMAET was approved in 2014 to integrate extension, seed, mechanisation and plant protection or quarantine.

Answer line: Its four functions remain essential even though the old umbrella is no longer the current administrative map.

Keywords: NMAET; SMAE; SMSP; SMAM; SMPPQ

Claim -> named evidence -> analysis -> qualification

- **Claim:** Its four functions remain essential even though the old umbrella is no longer the current administrative map.
- **Named evidence:** The 2014 Cabinet approval and PIB materials identify the four sub-missions.
- **Analysis:** Together they cover knowledge dissemination, planting material, equipment access and biological risk management.
- **Qualification:** Remembering only the historical acronym obscures the later redistribution of its functions.

Evidence: The 2014 Cabinet approval and PIB materials identify the four sub-missions.

UPSC trap: Do not list all four as unchanged current NMAET sub-missions.

Mains use: First give the classic architecture, then map each function to its current home.

Recap: NMAET is historically important; its functions now travel through different current schemes.

Core Session 42: NMAET successor map

SMAE/SAME -> KRISHONNATI | SMSP -> NFSNM | SMAM -> PM-RKVY | SMPPQ -> PPQ SYSTEM

Visual first: The rail fixes the operating mechanism before the prose.

Definition: The former NMAET functions have been rationalised into different current administrative arrangements.

Answer line: Current status must be stated sub-mission by sub-mission.

Keywords: successor map; rationalisation; extension; seed; mechanisation; quarantine

Claim -> named evidence -> analysis -> qualification

- **Claim:** Current status must be stated sub-mission by sub-mission.
- **Named evidence:** Economic Survey 2025-26 and FY 2026-27 OOMF retain Agriculture Extension under Krishonnati; NFSNM guidelines merge SMSP into Seed Components; PM-RKVY contains SMAM including crop-residue management.
- **Analysis:** Plant protection and quarantine continue through the plant-protection regulatory and programme system rather than a clearly reconstituted NMAET umbrella.
- **Qualification:** A continuing function is not proof that the old umbrella remains current.

Evidence: Economic Survey 2025-26 and FY 2026-27 OOMF retain Agriculture Extension under Krishonnati; NFSNM guidelines merge SMSP into Seed Components; PM-RKVY contains SMAM including crop-residue management.

UPSC trap: Do not answer a current-status question with the 2014 organisational chart alone.

Mains use: Use a four-arrow successor map with dated official documents.

Recap: NMAET's functions continue, but the original umbrella has fragmented into current successors.

Core Session 43: Current Agriculture Extension

MANAGE/EEI + ATMA + KISAN CALL CENTRE + AC&ABC

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Current agricultural extension under Krishonnati combines central capacity building with state ATMA delivery and farmer outreach.

Answer line: Extension is a system of learning and feedback, not a one-way message service.

Keywords: SAME; ATMA; MANAGE; EEI; advisory

Claim -> named evidence -> analysis -> qualification

- **Claim:** Extension is a system of learning and feedback, not a one-way message service.
- **Named evidence:** FY 2026-27 OOMF targets 15,91,088 ATMA training beneficiaries, 22 Kisan Call Centres and 50 lakh advisories, while explicitly treating adoption as not instantly measurable.
- **Analysis:** The framework recognises the difference between training output and later technology adoption.
- **Qualification:** Large advisory counts may include repeated recipients and say little about relevance, comprehension or action.

Evidence: FY 2026-27 OOMF targets 15,91,088 ATMA training beneficiaries, 22 Kisan Call Centres and 50 lakh advisories, while explicitly treating adoption as not instantly measurable.

UPSC trap: Do not count messages sent as technologies adopted.

Mains use: Evaluate reach, local fit, feedback, adoption and outcome separately.

Recap: Extension creates informed capability only when advice is trusted, feasible and acted upon.

Core Session 44: Current agricultural mechanisation

SMAM IN PM-RKVY -> CHC/FMB -> SMALLHOLDER ACCESS -> UTILISATION

Visual first: The rail fixes the operating mechanism before the prose.

Definition: SMAM is currently a PM-RKVY component that promotes machinery access, custom hiring, training, testing and crop-residue management.

Answer line: Service access can be more inclusive than ownership subsidy for small farms.

Keywords: SMAM; custom hiring; farm machinery bank; testing; utilisation

Claim -> named evidence -> analysis -> qualification

- **Claim:** Service access can be more inclusive than ownership subsidy for small farms.
- **Named evidence:** FY 2026-27 OOMF targets assistance to 1.5 lakh beneficiaries, 5,000 custom-hiring or hi-tech hubs and 10,000 trained stakeholders.
- **Analysis:** Custom hiring spreads fixed cost across users and offsets smallholding diseconomies.
- **Qualification:** Machine purchase or centre creation does not prove uptime, affordable hire, timely access or labour-sensitive gains.

Evidence: FY 2026-27 OOMF targets assistance to 1.5 lakh beneficiaries, 5,000 custom-hiring or hi-tech hubs and 10,000 trained stakeholders.

UPSC trap: Do not measure mechanisation by asset count alone.

Mains use: Use hours, users, timeliness, repair uptime and net cost as companion indicators.

Recap: Mechanisation succeeds when a reliable service improves timeliness and net returns.

Core Session 45: Plant protection and quarantine

SURVEILLANCE -> IPM -> QUALITY CONTROL -> QUARANTINE -> RAPID RESPONSE

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Plant protection and quarantine technology combines surveillance, integrated pest management, pesticide regulation and border biosecurity.

Answer line: It is a public-risk function that continues beyond the old NMAET label.

Keywords: IPM; quarantine; surveillance; pesticide quality; biosecurity

Claim -> named evidence -> analysis -> qualification

- **Claim:** It is a public-risk function that continues beyond the old NMAET label.
- **Named evidence:** DA&FW's current plant-protection system operates CIPMCs, laboratories, statutory registration and Plant Quarantine Order implementation.
- **Analysis:** Early detection and coordinated response protect many farms, creating spillovers that private individual action underprovides.
- **Qualification:** Regulatory activity and mission expenditure are distinct; not every current function has a separately evidenced current mission outlay.

Evidence: DA&FW's current plant-protection system operates CIPMCs, laboratories, statutory registration and Plant Quarantine Order implementation.

UPSC trap: Do not describe plant quarantine as only an extension activity.

Mains use: Classify it as regulation, surveillance and technology dissemination together.

Recap: Plant protection is a continuing public system even after NMAET restructuring.

Core Session 46: Technology Mission on Cotton: historical model

2000 TMC: MM-I RESEARCH | MM-II TRANSFER | MM-III MARKETS | MM-IV GINNING

Visual first: The rail fixes the operating mechanism before the prose.

Definition: The historical Technology Mission on Cotton was launched in February 2000 with four linked mini-missions.

Answer line: It is the clearest farm-to-fibre illustration of mission-mode complementarity.

Keywords: TMC; cotton; four mini-missions; market yard; ginning

Claim -> named evidence -> analysis -> qualification

- **Claim:** It is the clearest farm-to-fibre illustration of mission-mode complementarity.
- **Named evidence:** PIB records research and technology generation, transfer and farm development, market-infrastructure improvement, and ginning or pressing modernisation.
- **Analysis:** The structure addressed yield, fibre quality, contamination, marketing and processing as one chain.
- **Qualification:** It belongs to a historical programme and must not be merged with the 2026 successor mission.

Evidence: PIB records research and technology generation, transfer and farm development, market-infrastructure improvement, and ginning or pressing modernisation.

UPSC trap: Do not assign the old four mini-missions to the current cotton mission.

Mains use: Use TMC to demonstrate why post-harvest quality is part of agricultural technology policy.

Recap: Historical TMC joined research, farm transfer, markets and processing in one value-chain mission.

Core Session 47: Mission for Cotton Productivity: current

2026-27--2030-31 | RS 5,659.22 CR | 3 NEW MINI-MISSIONS

Visual first: The rail fixes the operating mechanism before the prose.

Definition: The Cabinet-approved Mission for Cotton Productivity is the current five-year cotton mission beginning in 2026-27.

Answer line: It is a successor policy, not a revival of the old four-mini-mission TMC structure.

Keywords: cotton productivity; 2026; Kapas Kranti; Kapas Kanti; Navya Fibre

Claim -> named evidence -> analysis -> qualification

- **Claim:** It is a successor policy, not a revival of the old four-mini-mission TMC structure.
- **Named evidence:** The May 2026 approval provides Rs 5,659.22 crore and three mini-missions: Kapas Kranti, Kapas Kanti and Navya Fibre.
- **Analysis:** The mission links productivity and sustainability, quality enhancement and allied natural-fibre diversification with DARE, ICAR and the Textiles Ministry.
- **Qualification:** Targets of 755 kg lint/ha and 498 lakh bales by 2030-31 are approved targets, not current performance.

Evidence: The May 2026 approval provides Rs 5,659.22 crore and three mini-missions: Kapas Kranti, Kapas Kanti and Navya Fibre.

UPSC trap: Do not mix the current three names with the historical four functions.

Mains use: Date the successor and connect the agriculture-textiles institutional boundary.

Recap: Current cotton policy retains value-chain logic through a new three-part mission.

Core Session 48: Jute Technology Mission: historical

2006 APPROVAL -> RESEARCH -> TRANSFER/RETTING -> RAW-JUTE MARKET -> INDUSTRY

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Jute Technology Mission was a historical Agriculture-Textiles value-chain mission linked to the National Jute Policy 2005.

Answer line: Its mission period is closed; current jute programmes should not be called JTM without a successor order.

Keywords: JTM; retting; raw jute; industry modernisation; historical

Claim -> named evidence -> analysis -> qualification

- **Claim:** Its mission period is closed; current jute programmes should not be called JTM without a successor order.
- **Named evidence:** The 2006 mission had a proposed Rs 355.55 crore and four mini-missions spanning research, technology transfer, raw-jute marketing and industry modernisation or promotion.
- **Analysis:** The design recognised that fibre quality depends on farm practices, retting, market grading and industrial processing.
- **Qualification:** Official reporting extended or completed activities into the early 2010s, but no current JTM phase was located.

Evidence: The 2006 mission had a proposed Rs 355.55 crore and four mini-missions spanning research, technology transfer, raw-jute marketing and industry modernisation or promotion.

UPSC trap: Do not present JTM as an operating FY 2026-27 mission.

Mains use: Use it as a historical value-chain example and label the closure.

Recap: JTM's analytical value survives, but its mission status is historical.

Core Session 49: Digital Agriculture Mission: cross-link

AGRISTACK + DIGITAL CROP SURVEY + DECISION SUPPORT -> TOPIC 27

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Digital Agriculture Mission is a current agricultural mission that builds digital public infrastructure and data-enabled services.

Answer line: Topic 29 owns its place in mission architecture; Topic 27 owns technical and data-governance depth.

Keywords: Digital Agriculture Mission; AgriStack; registry; crop survey; cross-link

Claim -> named evidence -> analysis -> qualification

- **Claim:** Topic 29 owns its place in mission architecture; Topic 27 owns technical and data-governance depth.
- **Named evidence:** The 2 September 2024 Cabinet approval carried Rs 2,817 crore; FY 2026-27 OOMF retains farmer-ID and digital crop-survey outputs.
- **Analysis:** Digital infrastructure can improve verification, targeting and feedback across other missions.
- **Qualification:** Registries and dashboards do not prove inclusion, advisory quality, consent or farmer welfare.

Evidence: The 2 September 2024 Cabinet approval carried Rs 2,817 crore; FY 2026-27 OOMF retains farmer-ID and digital crop-survey outputs.

UPSC trap: Do not duplicate Topic 27's detailed platform architecture here.

Mains use: Use DAM as an enabling horizontal mission and state the boundary.

Recap: Digital systems support mission delivery; they are not the agricultural outcome themselves.

Core Session 50: National Mission on High-Yielding Seeds: status caution

BUDGET 2025-26 ANNOUNCEMENT -> NO STANDALONE APPROVAL/GUIDELINE LOCATED

Visual first: The rail fixes the operating mechanism before the prose.

Definition: The National Mission on High-Yielding Seeds was announced in Union Budget 2025-26 to strengthen research and propagation of high-yielding and climate-resilient varieties.

Answer line: Announcement must not be upgraded into a fully operational standalone mission without approval and guidelines.

Keywords: high-yielding seeds; announcement; approval; propagation; status

Claim -> named evidence -> analysis -> qualification

- **Claim:** Announcement must not be upgraded into a fully operational standalone mission without approval and guidelines.
- **Named evidence:** Current NFSNM already contains seed components, newly released varieties, SRR, VRR and infrastructure interventions.
- **Analysis:** The announced mission direction could strengthen research-to-seed-chain coordination if separately approved and funded.
- **Qualification:** No standalone Cabinet approval, operational guideline, outlay or current target was located by 10 September 2026.

Evidence: Current NFSNM already contains seed components, newly released varieties, SRR, VRR and infrastructure interventions.

UPSC trap: Do not invent an outlay, launch date or implementation coverage.

Mains use: Label it 'announced; standalone operational status not established'.

Recap: Seed-mission intent is official, but current standalone implementation remains unverified.

Core Session 51: Krishonnati Yojana current umbrella

FY 2025-26 SURVEY: 8 SCHEMES -> FY 2026-27 OUTLAY RS 11,200 CR

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Krishonnati Yojana is the current science-based umbrella for production, extension, digital, market and edible-oil missions.

Answer line: Its component list is date-specific and should not be projected backwards.

Keywords: Krishonnati; umbrella; NFSNM; MIDH; NMEO

Claim -> named evidence -> analysis -> qualification

- **Claim:** Its component list is date-specific and should not be projected backwards.
- **Named evidence:** Economic Survey 2025-26 lists MIDH, NFSNM, Agriculture Extension, ISAM, DAM, NMEO-OS, NMEO-OP and MOVCDNER; Union Budget 2026-27 provides Rs 11,200 crore BE for the umbrella.
- **Analysis:** The umbrella can reduce duplication and permit coordinated annual action planning.
- **Qualification:** An aggregate umbrella outlay cannot be assigned to each component without a scheme-wise allocation table.

Evidence: Economic Survey 2025-26 lists MIDH, NFSNM, Agriculture Extension, ISAM, DAM, NMEO-OS, NMEO-OP and MOVCDNER; Union Budget 2026-27 provides Rs 11,200 crore BE for the umbrella.

UPSC trap: Do not quote Rs 11,200 crore as the budget of MIDH, NFSNM or NMEO individually.

Mains use: Use the umbrella only to explain current administrative placement.

Recap: Krishonnati is a dated umbrella; component missions retain distinct designs and targets.

Core Session 52: PM-RKVY current cafeteria

STATE FLEXIBILITY -> NINE COMPONENTS -> LOCAL PORTFOLIO -> OUTCOME GUARDRAILS

Visual first: The rail fixes the operating mechanism before the prose.

Definition: PM-RKVY is a current centrally sponsored cafeteria scheme that lets states combine approved components around local agricultural priorities.

Answer line: Flexibility supports adaptation but requires protection against substitution and weak accountability.

Keywords: PM-RKVY; cafeteria; state flexibility; annual action plan; convergence

Claim -> named evidence -> analysis -> qualification

- **Claim:** Flexibility supports adaptation but requires protection against substitution and weak accountability.
- **Named evidence:** The 14 November 2024 guidelines list DPR, PDMC, SMAM including CRM, SH&F, PKVY, RAD, Agroforestry, Crop Diversification and the agri-start-up fund.
- **Analysis:** States can select portfolios suited to agro-climate rather than follow one uniform physical package.
- **Qualification:** Flexible reallocation can underfund less visible public goods unless outcomes and minimum functions are monitored.

Evidence: The 14 November 2024 guidelines list DPR, PDMC, SMAM including CRM, SH&F, PKVY, RAD, Agroforestry, Crop Diversification and the agri-start-up fund.

UPSC trap: Do not call every PM-RKVY component a separate technology mission.

Mains use: Contrast a flexible umbrella scheme with a tightly targeted mission.

Recap: PM-RKVY enables local portfolios; mission discipline still requires common outcomes.

Core Session 53: Funding architecture and federalism

UNION GUIDELINE + STATE SHARE + DISTRICT PLAN + IMPLEMENTER + FARMER

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Most agricultural missions combine Union policy and finance with state planning and district implementation.

Answer line: Funding ratio is only one part of federal capacity; timing, staffing and local discretion determine delivery.

Keywords: Centrally Sponsored Scheme; central sector; state share; SLSC; annual action plan

Claim -> named evidence -> analysis -> qualification

- **Claim:** Funding ratio is only one part of federal capacity; timing, staffing and local discretion determine delivery.
- **Named evidence:** MIDH uses 60:40 and 90:10 patterns with specified 100% Union-funded institutions; NMEO-OS is a centrally sponsored scheme under Krishonnati.
- **Analysis:** State co-financing can create ownership and adaptation, while national committees preserve standards and strategic goals.
- **Qualification:** Matching requirements and delayed releases can disadvantage fiscally or administratively weaker states.

Evidence: MIDH uses 60:40 and 90:10 patterns with specified 100% Union-funded institutions; NMEO-OS is a centrally sponsored scheme under Krishonnati.

UPSC trap: Do not infer equal implementation from a common national guideline.

Mains use: Add state capacity, seasonal timing and district planning to any funding analysis.

Recap: Federal mission performance depends on money, authority, capability and timing together.

Core Session 54: Adoption constraints: smallholders and tenancy

INDIVISIBLE ASSET + SHORT TENURE + CREDIT RISK + MARKET RISK -> HIGH THRESHOLD

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Small scale, insecure tenancy and liquidity constraints can make a socially useful technology privately infeasible.

Answer line: Inclusive mission design must change access conditions, not merely advertise benefits.

Keywords: smallholder; tenancy; liquidity; indivisibility; custom hiring

Claim -> named evidence -> analysis -> qualification

- **Claim:** Inclusive mission design must change access conditions, not merely advertise benefits.
- **Named evidence:** Custom-hiring centres under SMAM, FPO aggregation under cluster missions and gestation support under NMEO-OP are institutional responses to adoption constraints.
- **Analysis:** Shared services lower fixed cost, aggregation improves bargaining and transition support bridges delayed returns.
- **Qualification:** Land-record targeting can exclude tenants, while group models can be captured by larger members.

Evidence: Custom-hiring centres under SMAM, FPO aggregation under cluster missions and gestation support under NMEO-OP are institutional responses to adoption constraints.

UPSC trap: Do not treat asset subsidy as a universal smallholder solution.

Mains use: Specify the constraint and match it to service, finance, tenure or market reform.

Recap: Inclusion requires lowering the actual adoption threshold for the intended farmer.

Core Session 55: Gender, labour and social distribution

TECHNOLOGY -> TASK CHANGE -> TIME/DRUDGERY/EMPLOYMENT -> DISTRIBUTIONAL EFFECT

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Technology changes who performs work, controls assets and receives income, not only aggregate productivity.

Answer line: A mission outcome is incomplete without gender and labour incidence.

Keywords: gender; drudgery; labour displacement; asset control; social inclusion

Claim -> named evidence -> analysis -> qualification

- **Claim:** A mission outcome is incomplete without gender and labour incidence.
- **Named evidence:** Mechanisation can reduce drudgery and improve timeliness, while training and beneficiary design determine whether women and marginal groups control the service or asset.
- **Analysis:** Distributional indicators reveal whether gains accrue to landowners, tenants, labourers, women or processor-linked clusters.
- **Qualification:** Time savings can coexist with task displacement or loss of wage work, requiring local analysis and reskilling.

Evidence: Mechanisation can reduce drudgery and improve timeliness, while training and beneficiary design determine whether women and marginal groups control the service or asset.

UPSC trap: Do not use household benefit as a substitute for women's control over technology and income.

Mains use: Add one sentence on task, ownership, access and compensation.

Recap: Technology missions redistribute work and power as well as output.

Core Session 56: Ecological fit and rebound

EFFICIENCY PER HECTARE -> LOWER UNIT COST -> AREA EXPANSION -> TOTAL RESOURCE USE?

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Ecological fit asks whether the promoted crop and technology match water, soil, biodiversity and landscape limits.

Answer line: Efficiency per unit does not guarantee lower total resource use.

Keywords: ecological fit; rebound; water budget; land use; genetic diversity

Claim -> named evidence -> analysis -> qualification

- **Claim:** Efficiency per unit does not guarantee lower total resource use.
- **Named evidence:** Oil palm, protected cultivation, irrigation and high-response varieties illustrate why resource budgets must accompany productivity targets.
- **Analysis:** A water-saving technology can raise profitability and expand area, offsetting per-hectare savings.
- **Qualification:** Mission dashboards often measure promoted area more readily than basin withdrawal, pesticide load or land-use change.

Evidence: Oil palm, protected cultivation, irrigation and high-response varieties illustrate why resource budgets must accompany productivity targets.

UPSC trap: Do not call a technology sustainable solely because it is input-efficient per unit.

Mains use: Measure total resource use, land conversion and resilience alongside yield.

Recap: Sustainability is a system outcome, not an efficiency label.

Core Session 57: Markets, procurement and conflicting signals

MISSION SUPPLY PUSH + PRICE/TRADE POLICY + BUYER CAPACITY = FARM RETURN

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Technology missions interact with MSP, procurement, imports, exports and processor demand.

Answer line: A production mission can fail economically when market policy sends a conflicting price signal.

Keywords: procurement; trade policy; market signal; processor demand; price risk

Claim -> named evidence -> analysis -> qualification

- **Claim:** A production mission can fail economically when market policy sends a conflicting price signal.
- **Named evidence:** The pulses mission adds procurement support, NMEO clusters link processors, and MIDH funds post-harvest capacity.
- **Analysis:** Stable demand and transparent quality standards encourage adoption by reducing output-price risk.
- **Qualification:** Permanent protection can raise consumer cost or lock resources into an inefficient crop; imports may still be needed for resilience.

Evidence: The pulses mission adds procurement support, NMEO clusters link processors, and MIDH funds post-harvest capacity.

UPSC trap: Do not evaluate production technology independently of output-market incentives.

Mains use: Trace the price and buyer channel after the farm gate.

Recap: Mission supply must be matched by competitive demand and coherent trade policy.

Core Session 58: Mission proliferation and rebranding

NEW LABEL -> OVERLAP? -> CLEAR OWNER? -> ADDITIONAL CAPABILITY? -> SUNSET OLD FORM

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Mission proliferation occurs when new labels accumulate without retiring or integrating old responsibilities.

Answer line: A successor is justified by additional capability, not publicity.

Keywords: proliferation; rebranding; overlap; accountability; additional capability

Claim -> named evidence -> analysis -> qualification

- **Claim:** A successor is justified by additional capability, not publicity.
- **Named evidence:** Oilseed, extension and sustainability architectures have repeatedly shifted across TMO, ISOPOM, NMOOP, NFSM, NMEQ, NMAET, Krishonnati and PM-RKVY.
- **Analysis:** Rationalisation can reduce duplication and align current bottlenecks with specialist missions.
- **Qualification:** Renaming can also obscure time-series comparison, liabilities and responsibility for past outcomes.

Evidence: Oilseed, extension and sustainability architectures have repeatedly shifted across TMO, ISOPOM, NMOOP, NFSM, NMEQ, NMAET, Krishonnati and PM-RKVY.

UPSC trap: Do not treat administrative renaming as evidence of success or failure.

Mains use: Ask what function, funding, target and accountability changed.

Recap: Rebranding matters only when the theory of change and capability genuinely improve.

Core Session 59: Evaluation by additionality

MISSION AREA - COMPARABLE NON-MISSION TREND -> INCREMENTAL EFFECT

Visual first: The rail fixes the operating mechanism before the prose.

Definition: An additionality evaluation estimates whether mission-supported areas improved more than a credible comparison after controlling for baseline differences.

Answer line: The correct question is 'what changed because of the mission?'

Keywords: difference; comparison; baseline; spillover; selection bias

Claim -> named evidence -> analysis -> qualification

- **Claim:** The correct question is 'what changed because of the mission?'
- **Named evidence:** Cluster and phased mission rollout can sometimes support matched district or difference-in-differences analysis.
- **Analysis:** A credible comparison separates mission influence from national rainfall, price and technology trends.
- **Qualification:** Political selection of high-potential clusters and spillovers into comparison areas can bias estimates.

Evidence: Cluster and phased mission rollout can sometimes support matched district or difference-in-differences analysis.

UPSC trap: Do not rely only on beneficiary self-report or before-after national averages.

Mains use: State the counterfactual and the most important selection problem.

Recap: Additionality converts monitoring evidence into a causal policy judgement.

Core Session 60: Evaluation by outcomes and cost

NET INCOME + QUALITY + RESILIENCE + IMPORT EFFECT + ECOLOGY / PUBLIC COST

Visual first: The rail fixes the operating mechanism before the prose.

Definition: Cost-effectiveness asks how much public cost produced a specified outcome; cost-benefit analysis values a wider set of gains and losses.

Answer line: A mission should be judged on net public value, not only physical achievement.

Keywords: cost-effectiveness; cost-benefit; net income; public value; lifecycle

Claim -> named evidence -> analysis -> qualification

- **Claim:** A mission should be judged on net public value, not only physical achievement.
- **Named evidence:** A complete oilseed evaluation would compare public cost with yield, oil recovery, farmer margins, import exposure and ecological change.
- **Analysis:** The framework reveals whether cheaper alternatives or public goods could deliver the same outcome.
- **Qualification:** Monetising resilience, biodiversity and distribution is difficult, so quantified results need a transparent qualitative ledger.

Evidence: A complete oilseed evaluation would compare public cost with yield, oil recovery, farmer margins, import exposure and ecological change.

UPSC trap: Do not divide outlay by beneficiaries and call the result economic efficiency.

Mains use: Specify outcome, time horizon, counterfactual and distribution before judging value for money.

Recap: Mission efficiency is cost per durable outcome, not cost per activity.

Core Session 61: Evaluation by regional equity and convergence

WHO GAINED? | WHERE? | WHICH LINK FAILED? | DID AGENCIES ACT TOGETHER?

Visual first: The rail fixes the operating mechanism before the prose.

Definition: An equity-convergence audit disaggregates outcomes and tests whether required agencies delivered their linked responsibilities.

Answer line: Average success can hide excluded groups and failed links.

Keywords: equity audit; convergence audit; disaggregation; responsibility; bottleneck

Claim -> named evidence -> analysis -> qualification

- **Claim:** Average success can hide excluded groups and failed links.
- **Named evidence:** ATMA plans, KVK evidence, state action plans, seed supply, finance and market infrastructure can be mapped against the same district outcome.
- **Analysis:** The audit identifies whether low adoption reflects unsuitable technology, missing finance, weak extension or absent buyers.
- **Qualification:** Administrative datasets may use incompatible beneficiary identifiers or reporting periods.

Evidence: ATMA plans, KVK evidence, state action plans, seed supply, finance and market infrastructure can be mapped against the same district outcome.

UPSC trap: Do not blame farmers for non-adoption before auditing the delivery chain.

Mains use: Join distributional data with a responsibility matrix.

Recap: Equity and convergence evaluation explains both who was missed and why.

Core Session 62: Evaluation by sunset and institutional learning

EVIDENCE -> CONTINUE | SCALE | REDESIGN | MAINSTREAM | CLOSE

Visual first: The rail fixes the operating mechanism before the prose.

Definition: A sunset evaluation determines whether temporary mission instruments should continue, change form or end.

Answer line: Failure reporting is an input to learning, not an embarrassment to be suppressed.

Keywords: sunset evaluation; institutional learning; scale; redesign; closure

Claim -> named evidence -> analysis -> qualification

- **Claim:** Failure reporting is an input to learning, not an embarrassment to be suppressed.
- **Named evidence:** Mission succession in oilseeds and the redistribution of NMAET functions show that administrative evolution is normal.
- **Analysis:** Explicit decision rules prevent permanent subsidies, obsolete metrics and stranded assets.
- **Qualification:** Premature closure can interrupt perennial crops, seed multiplication and local service networks with long gestation.

Evidence: Mission succession in oilseeds and the redistribution of NMAET functions show that administrative evolution is normal.

UPSC trap: Do not apply one sunset date to assets and outcomes with different time horizons.

Mains use: Set stage-specific review dates and transition plans.

Recap: A learning mission changes or ends when evidence shows the original instrument is no longer best.

Core Session 63: National Horticulture Mission: 2018 PYQ demand

PRODUCTION + PRODUCTIVITY + INCOME -> ASSESS HOW FAR

Visual first: The rail fixes the operating mechanism before the prose.

Definition: The 2018 GS-III question requires a graded assessment of NHM's contribution to output, productivity and farm income.

Answer line: The directive 'assess' demands both contribution and limits to income conversion.

Keywords: NHM; 2018 PYQ; productivity; income; assessment

Claim -> named evidence -> analysis -> qualification

- **Claim:** The directive 'assess' demands both contribution and limits to income conversion.
- **Named evidence:** NHM promoted region-specific planting material, production technology and post-harvest support and later became a MIDH component.
- **Analysis:** Higher quality and lower loss can raise value, but perishability, gluts, fragmented holdings and weak bargaining can keep net income gains uneven.
- **Qualification:** National horticulture growth is not a mission-only causal estimate.

Evidence: NHM promoted region-specific planting material, production technology and post-harvest support and later became a MIDH component.

UPSC trap: Do not answer only with a list of MIDH components.

Mains use: Use mechanism, evidence, income constraints and a graded verdict.

Recap: NHM strengthened capability; income success depends on post-harvest and market conversion.

Core Session 64: Palm-oil 2021 Prelims distinctions

ORIGIN: TROPICAL AFRICA | MESOCARP: PALM OIL | KERNEL: PALM-KERNEL OIL

Visual first: The rail fixes the operating mechanism before the prose.

Definition: The oil-palm PYQ tests botanical origin and product uses, not the administrative details of NMEO-OP.

Answer line: Keep biological facts separate from mission status.

Keywords: Elaeis guineensis; mesocarp; kernel; biodiesel; origin

Claim -> named evidence -> analysis -> qualification

- **Claim:** Keep biological facts separate from mission status.
- **Named evidence:** African oil palm is native to tropical West and Central Africa; palm oil is used in food and non-food industries and can be a biodiesel feedstock.
- **Analysis:** South-East Asia's production dominance does not change botanical origin.
- **Qualification:** Commercial uses vary by derivative and formulation; the official option letter is withheld without a matched final key.

Evidence: African oil palm is native to tropical West and Central Africa; palm oil is used in food and non-food industries and can be a biodiesel feedstock.

UPSC trap: Do not confuse current production geography with species origin.

Mains use: Evaluate each statement independently and withhold the answer letter absent the official key.

Recap: Origin, mesocarp product, kernel product and uses are distinct prelims facts.

Core Session 65: Answer architecture: M-I-S-S-I-O-N

M PROBLEM | I INNOVATION | S SEED/SKILL | S STATE CONVERGENCE | I INCLUSION | O OUTCOME | N NEXT STEP

Visual first: The rail fixes the operating mechanism before the prose.

Definition: A technology-mission answer should move from the diagnosed bottleneck to technology, delivery, adoption, outcomes and redesign.

Answer line: A scheme catalogue without causal links earns little analytical value.

Keywords: problem; innovation; diffusion; convergence; inclusion; outcome; redesign

Claim -> named evidence -> analysis -> qualification

- **Claim:** A scheme catalogue without causal links earns little analytical value.
- **Named evidence:** Named evidence can come from TMO, NFSNM, NMEO-OS, MIDH, NMSA, NMAET successors or the cotton missions, with dates and status.
- **Analysis:** The framework forces the answer to connect instruments with farmers, markets, ecology and evaluation.
- **Qualification:** One or two named missions are stronger than many unqualified acronyms.

Evidence: Named evidence can come from TMO, NFSNM, NMEO-OS, MIDH, NMSA, NMAET successors or the cotton missions, with dates and status.

UPSC trap: Do not conclude with 'better implementation is needed' without specifying the failed link.

Mains use: Use one mission as evidence, one limitation and one redesign rule.

Recap: High-scoring answers explain the chain and deliver a qualified verdict.

Core Session 66: Final mission scorecard

PROBLEM | TARGET | CONVERGENCE | ADOPTION | VALUE CHAIN | EQUITY | ECOLOGY | ADDITIONALITY | SUNSET

Visual first: The rail fixes the operating mechanism before the prose.

Definition: A mission scorecard is a disciplined set of questions for judging design, implementation and public value.

Answer line: Mission success is durable inclusive additionality without unacceptable ecological or fiscal lock-in.

Keywords: scorecard; additionality; regional equity; convergence; sunset

Claim -> named evidence -> analysis -> qualification

- **Claim:** Mission success is durable inclusive additionality without unacceptable ecological or fiscal lock-in.
- **Named evidence:** Current official documents provide dated targets and output-outcome tables, while historical missions provide predecessor and design evidence.
- **Analysis:** The scorecard prevents target achievement from crowding out causation, distribution and sustainability.
- **Qualification:** Some dimensions require qualitative judgement because data and counterfactuals are incomplete.

Evidence: Current official documents provide dated targets and output-outcome tables, while historical missions provide predecessor and design evidence.

UPSC trap: Do not give a binary success or failure verdict from one national statistic.

Mains use: Conclude with continue, scale, redesign, mainstream or close.

Recap: The best mission is not the loudest label but the most credible conversion of public effort into durable public value.

Optional Advanced

A. Mission-oriented innovation

Directionality is justified when food security, climate resilience, disease surveillance or strategic import exposure creates a public problem that private innovation will underprovide. It becomes dangerous when one vendor, variety or crop is protected after contrary evidence emerges.

B. Weakest-link production function

When research R, seed supply S, extension E, complements C and market readiness M are strong complements, mission outcome behaves like $f(R, S, E, C, M)$: a near-zero value in one link sharply reduces the whole result.

C. Principal-agent chain

Union -> State -> District -> Implementer -> Vendor/extension worker -> Farmer. Information loss and shifted incentives grow at each step. Independent verification, separated procurement and outcome certification, and within-season grievance correction reduce the risk.

D. Diffusion and selection

Early adopters are often larger, irrigated or better connected. Their success cannot establish universal suitability. Diffusion analysis must identify farmers remaining below the adoption threshold and test whether the cause is risk, tenure, scale, labour, service or market access.

E. Path dependence

Subsidised assets, specialised processing and procurement can create a constituency and high switching cost. Redesign therefore needs open standards, alternative buyers, transition support and an asset-reuse plan.

F. Environmental rebound

Lower resource use per hectare can raise profitability and expand area, increasing total basin or landscape use. Evaluate total withdrawals, land-use change, pesticide load, biodiversity and lifecycle processing effects.

G. Evaluation design

Use process audits for delivery, matched baseline-endline comparisons for adoption, credible quasi-experiments where feasible for attribution, cost-effectiveness for value, distributional incidence for equity, and multi-season panels for persistence.

H. D-I-F-F-U-S-E answer lens

Diagnosed problem -> Innovation portfolio -> Federal convergence -> Farmer adoption -> Upstream/downstream value chain -> Sustainability and social inclusion -> Evaluation, exit and evolution.

Consolidated Register Notes

Mission-mode core

- Mission = defined bottleneck + time-bound outcome + dedicated coordination + convergence + monitoring + feedback + exit rule.
- Scheme = financing and eligibility instrument; programme = activity bundle. Labels overlap, so use the operative dated document.
- Results chain: input -> activity -> output -> adoption -> outcome -> impact.
- Mission versus routine scheme: outcome and research-to-market accountability versus isolated activity and indefinite continuation.

Timeline and status rail

Mission/programme	Dated status at 10 September 2026
Technology Mission on Oilseeds	Historical; launched May 1986; later subsumed through ISOPOM and successor umbrellas.
ISOPOM / NMOOP / NFSM-Oilseeds	Historical or subsumed predecessor stages; do not call current.
NMEO-OS	Current CSS, 2024-25 to 2030-31; Rs 10,103.38 crore approved outlay.
NMEO-OP	Original approved phase 2021-22 to 2025-26, Rs 11,040 crore; FY 2026-27 OOMF retains targets, but a separate extension order was not located.
NFSM / NFSNM	NFSM launched October 2007; current FY 2026-27 mission is NFSNM with seven components.
Mission for Aatmanirbharta in Pulses	Current, 2025-26 to 2030-31; Rs 11,440 crore.
Millets	Current Union mission label is NFSNM Sub-Mission on Nutri-Cereals; no separate current National Millet Mission was established.
NMSA	Continuing climate-policy mission; major delivery functions rationalised through PM-RKVY components.
NMNF	First approved phase ended March 2026; FY 2026-27 targets and 2026-31 expansion were approval-qualified in the OOMF.

Mission/programme	Dated status at 10 September 2026
NHM / MIDH	NHM launched 2005-06 and remains a sub-scheme of current MIDH; current guidelines dated 7 May 2026.
National Bamboo Mission	Current MIDH sub-scheme under 2025 guidelines; restructured from 2018.
National Beekeeping and Honey Mission	Approved extension ended 2025-26; no later extension located.
NMAET	Historical umbrella approved in 2014; its four functions now sit in different current arrangements.
Technology Mission on Cotton	Historical mission launched February 2000 with four mini-missions.
Mission for Cotton Productivity	Current, 2026-27 to 2030-31; Rs 5,659.22 crore; three new mini-missions.
Jute Technology Mission	Historical/closed value-chain mission approved in 2006.
Digital Agriculture Mission	Current horizontal mission; detailed architecture belongs to Topic 27.
National Mission on High-Yielding Seeds	Budget 2025-26 announcement; standalone approval, outlay and guideline not located by cutoff.

Current mission facts

- NFSNM components: rice, wheat, pulses, coarse cereals, Sub-Mission on Nutri-Cereals, commercial crops and seed components.
- NMEO-OS: over 600 value-chain clusters covering about 10 lakh hectares annually; 2.8 lakh hectares of demonstrations annually; 65 seed hubs; 50 specialised stores.
- MIDH 2026: NHM, HMNEH, NHB, CDB, NBM and CIH.
- Classic NMAET: SMAE, SMSP, SMAM and SMPPQ. Current map: extension under Krishonnati; SMSP merged into NFSNM; SMAM in PM-RKVY; plant protection/quarantine continues through its regulatory-programme system.
- Current cotton mission: Kapas Kranti, Kapas Kanti and Navya Fibre; never mix these with historical TMC's four mini-missions.

Institution map

- DARE/ICAR: research, varieties, breeder material, protocols and technical validation.
- KVK: on-farm testing, frontline demonstrations, capacity development and diagnostics.
- ATMA: autonomous district extension coordination, SREP, action plans and farmer feedback.
- State departments and missions: annual plans, implementation, convergence and monitoring.
- FPOs/co-operatives/custom-hiring centres: aggregation, shared services and bargaining.
- Private firms/processors: inputs, repair, processing and buyer channels, subject to competition and quality safeguards.

Mechanism and evaluation

- Lab-to-land-to-market: research -> adaptive trial -> quality material -> demonstration -> trusted extension -> finance/service -> adoption -> aggregation/processing -> market -> feedback.
- Adoption threshold: expected risk-adjusted net benefit must exceed purchase, finance, learning, transition, failure and market risks.
- Evaluation tests: additionality, outcomes, cost, regional equity, convergence, ecology, persistence and sunset.
- Goodhart safeguards: area with sustained adoption; kits with correct use; assets with uptime; demonstrations with independent diffusion; production with net income and loss reduction.

UPSC traps

- Mission title != mission-mode design.
- Allocation != expenditure; target != achievement; output != outcome; trend != attribution.
- TMO, NMOOP, NFSM-OS, NMEO-OS and NMEO-OP are not timeless synonyms.
- Oil palm is perennial and processor-dependent; high oil yield does not prove ecological fit.
- NHM remains within MIDH; the two names are not historically interchangeable.
- Current NFSNM seed component is the successor to SMSP.
- NBHM's approved period ended in 2025-26; NMNF's proposed next phase was not finally approved in the cited OOMF.
- Digital agriculture is a cross-link to Topic 27; sustainable input design is a cross-link to Topic 14.

Answer spine

DEFINE mission and exact bottleneck
-> DATE status, period, outlay and target
-> TRACE research-to-market mechanism
-> IDENTIFY ICAR/KVK/ATMA/state/market roles
-> TEST adoption, distribution and ecological fit
-> EVALUATE additionality, outcomes, regional equity and convergence
-> VERDICT: continue | scale | redesign | mainstream | sunset/close

ASCII master

=====

PANEL 1 MISSION TEST

defined bottleneck -> time-bound target -> coordinated institutions
technology + complements -> adoption -> outcome -> feedback/sunset
mission title alone does not satisfy this test

PANEL 2 RESULTS CHAIN

input -> activity -> output -> adoption -> outcome -> impact
allocation != expenditure != reach != sustained use != welfare
every arrow requires evidence and a counterfactual

PANEL 3 LAB-TO-LAND-TO-MARKET

ICAR/SAU research -> adaptive trial -> quality seed/material
-> KVK demonstration -> ATMA/state extension -> finance/service
-> farmer adoption -> FPO/processor/market -> feedback

PANEL 4 DIFFUSION MECHANISMS

FLD/CFLD | seed hubs | SRR/VRR | cluster | custom hiring
trusted advice | repair | water/input access | market demand
one near-zero complement can defeat a strong technology

PANEL 5 OILSEED AND OIL-PALM TIMELINE

TMO May 1986 -> ISOPOM 2004 -> NMOOP 2014-15 -> NFSM-OS
-> NME0-OS 2024-25--2030-31
NME0-OP approved 2021-22--2025-26; FY 2026-27 targets retained

PANEL 6 FOOD, PULSES AND MILLETS

NFSM Oct 2007 -> NFSNM: 7 current components in FY 2026-27
Pulses mission: 2025-26--2030-31, separate approval
millets: current NFSNM Sub-Mission on Nutri-Cereals, not invented standalone

PANEL 7 SUSTAINABILITY STATUS

NMSA under NAPCC -> current functions spread through PM-RKVY
RAD | PDMC | SH&F | PKVY | agroforestry
NMNF first phase ended Mar 2026; proposed next phase approval-qualified

PANEL 8 HORTICULTURE AND ALLIED MISSIONS

NHM 2005-06 -> MIDH 2014-15
2026 MIDH: NHM | HMNEH | NHB | CDB | NBM | CIH
NBHM approved phase ended 2025-26; no later extension located

PANEL 9 EXTENSION AND NMAET SUCCESSORS

classic NMAET: SMAE | SMSP | SMAM | SMPPQ
current: Extension/Krishonnati | Seeds/NFSNM | SMAM/PM-RKVY
plant protection/quarantine continues as regulatory-programme system

PANEL 10 COTTON AND JUTE

historical TMC 2000: research | transfer | market | ginning/pressing
current cotton mission 2026-27--2030-31: three new mini-missions
Jute Technology Mission: historical/closed value-chain example

PANEL 11 FAILURE AND EVALUATION

fragmentation | target gaming | exclusion | market mismatch | ecological rebound
evaluate additionality | outcomes | regional equity | convergence | public cost
administrative dashboard must be checked against farmer and field evidence

PANEL 12 ANSWER SPINE

define mission -> date status/outlay/target -> trace research-to-market
-> test adoption/equity/ecology -> assess additionality and convergence
-> verdict: continue | scale | redesign | mainstream | sunset/close
