Structured comparison from the foundation source layer.

KEY DATA

Concept	Exam-ready meaning
☐ Hazard	"A dangerous condition or event, that threat or have the potential for causing injury to life or damage to property or the environment" — natural (geophysical, hydrological, climatological, meteorological, biological) or anthropogenic (PDF p. 4).
☐ Vulnerability	"Conditions determined by physical, social, economic, and environmental factors or processes, which increase the susceptibility of a community to the impact of hazards" — economic, physical, social, environmental and attitudinal forms (PDF pp. 4-5).
☐ Risk	"A measure of the expected losses due to a hazard event occurring in a given area over a specific time period"; working relation "Risk = Probability of Hazard x Degree of Vulnerability" (PDF p. 5).
☐ Risk acceptance/avoidance/reduction/transfer	Four distinct ways of dealing with risk — informed acceptance of consequences; avoiding risk-generating activity; applying techniques to reduce likelihood/consequence; and shifting the burden (e.g. insurance) to another party (PDF p. 5).
☐ Rapid-onset vs. slow-onset disaster	Rapid onset (earthquake, cyclone, flood, tsunami) has sudden, acute impact; slow onset — "Creeping Emergencies" (climate change, desertification, soil degradation, drought) — unfolds over months or years and must be reflected in preparedness planning (PDF p. 6).
☐ Resilience	Not source-defined in a single VisionIAS line but built from its cycle/DRR material as the capacity of a system to resist, absorb, accommodate to and recover from a hazard's effects in a timely and efficient manner — the concept directly asked in 2024 Q17.

Concepts, Risk, Resilience and Sendai →
PYQ application

HIGH**Foundation · Mains framework****GS-III** Disaster
Management**INTRO & ORIGIN**

Exam-ready treatment of Mains framework.

Foundation learning layer: concepts → constitutional detail → UPSC application.

MAINS ANGLE

Define the specific risk in hazard-exposure-vulnerability-capacity terms (Section 3), never as a generic "disasters are increasing" statement. Route the answer through the disaster management cycle (Section 4), naming the specific phase engaged by the question. Where the question invokes global commitments, name Sendai's four priorities precisely, not a vague "international cooperation." Where "resilience" is asked, name specific framework elements (knowledge, robustness, redundancy, resourcefulness, rapid recovery), not a one-line definition alone. Close by relating the specific hazard/answer back to India's own plan (NDMP) and its acknowledged gaps (Section 6), showing awareness of both the global standard and the domestic shortfall.

HIGH**Advanced · Advanced proposition**GS-III Disaster
Management**INTRO & ORIGIN**

Exam-ready treatment of Advanced proposition.

Advanced learning layer: concepts → constitutional detail → UPSC application.

UPSC TRAPS

WRONG: Thesis: □□ Disaster risk in India is not merely a natural given — it is substantially co-produced by development choices (unregulated construction, floodplain encroachment, deforestation), so "resilience" cannot be answered as a static defensive quality; it must be measured, governed and continuously reinvested in, and the Sendai Framework's own architecture — priorities without binding force, targets without automatic enforcement — is itself a case study in the limits of global risk governance. **Boundary:** this topic does not itself analyse any named hazard (earthquake, flood, cyclone) in operational detail — it supplies the risk-governance and measurement layer that topics 05-13 apply hazard-by-hazard.

CORRECT: Recheck the precise constitutional rule, exception, or institutional limit.

GS-III Disaster
Management

INTRO & ORIGIN

Analytical claim: □□ VisionIAS's own account of urban flooding — "most of the urban areas have been built with little to no regard to the natural topography" (developed fully in topic 08) — and of landslides — roads and settlements built without regard to slope stability (PDF pp. 29-32) — are both instances of the same underlying phenomenon: risk is frequently *created* by development decisions made without risk information, not simply inherited from nature. A resilience answer that only discusses response capacity, without addressing this risk-creation loop, is analytically incomplete.

STATIC THEORY

- VisionIAS's own vulnerability typology names "attitudinal vulnerability" — a community's negative disposition toward change, producing dependence on external support (PDF p. 5) — a dimension rarely used in Mains answers, which typically stop at economic/ physical/social vulnerability; citing it signals deeper source engagement.

- ☐ ****Slow-onset disasters as an under-tested category relative to**

- their stated importance:** VisionIAS explicitly states slow-onset disasters "must find adequate reflection in disaster preparedness" because "societies lose their ability to derive sustenance... over a period of time" even without an immediately visible shock (PDF p. 6) — yet India's institutional response (topic 02) is historically built around rapid-onset events; this gap is a legitimate analytical point for a "critically examine" question.

HIGH**Advanced · Mains-ready framework****GS-III** Disaster Management**INTRO & ORIGIN**

Exam-ready treatment of Mains-ready framework.

Advanced learning layer: concepts → constitutional detail → UPSC application.

MAINS ANGLE

Central thesis: Disaster resilience is best analysed as the outcome of a continuous risk-governance cycle — understand risk, invest in reducing it, prepare and warn, respond, and recover in a way that does not recreate the same risk — and India's own National Disaster Management Plan illustrates, in its self-acknowledged lack of targets and timelines, the same accountability gap that limits the (voluntary) Sendai Framework at the global level. **Define resilience precisely** — the capacity to resist, absorb, accommodate and recover, not "returning to normal." **Name the resilience-framework elements** examiners expect: risk knowledge, robustness, redundancy, resourcefulness, rapid recovery and adaptive capacity. **Show the risk-creation loop** (Section 2) — resilience must contend with risk actively produced by development choices, not only natural hazard frequency. **Cite Sendai's four priorities and seven targets** (Section 5 of the Master Framework), and its status per the 2023 Midterm Review. **Diagnose India's domestic accountability gap** using NDMP 2016's self-acknowledged shortcomings (Section 3) as evidence. **Recommend measurable, financed, time-bound targets** as the corrective — directly answering the gap identified in Section 3. **Close by tying resilience back to risk-informed development** (Section 2's feedback loop), not ending on relief/response alone.
