

SOLVED PRACTICE WORKBOOK

Climate Risk, Adaptation and Loss and Damage - Learner-v2 Refreshed

UPSC complete learning session | Foundation to advanced | Concepts, evidence, practice and answer writing

Original deterministic study visual; labels are explanatory, not textual quotations.

Source order: repository knowledge -> official current linkage -> clearly marked analysis. No fabricated PYQs or statistics.

CONTENTS / WORKBOOK INDEX

Major learning parts and meaningful subtopics are listed in document order. Page numbers are generated from the final PDF layout; PDF bookmarks mirror the same hierarchy.

Climate Risk, Adaptation and Loss and Damage - Solved Practice Workbook 5

BASIC MCQS / REMEDIATION 5

Q1. Which statement correctly identifies Climate disaster risk equation?	5
Q2. Which option preserves the risk or institutional boundary of Climate disaster risk equation?	5
Q3. Which statement uses Climate disaster risk equation without changing its hazard, mandate or status?	5
Q4. Which option avoids the standard UPSC close-option trap about Climate disaster risk equation?	6
Q5. Which statement correctly identifies Hazard exposure vulnerability?	6
Q6. Which option preserves the risk or institutional boundary of Hazard exposure vulnerability?	6
Q7. Which statement uses Hazard exposure vulnerability without changing its hazard, mandate or status?	7
Q8. Which option avoids the standard UPSC close-option trap about Hazard exposure vulnerability?	7
Q9. Which statement correctly identifies Climate variability and climate change?	7
Q10. Which option preserves the risk or institutional boundary of Climate variability and climate change?	7
Q11. Which statement uses Climate variability and climate change without changing its hazard, mandate or status?	8
Q12. Which option avoids the standard UPSC close-option trap about Climate variability and climate change?	8
Q13. Which statement correctly identifies Attribution boundary?	8
Q14. Which option preserves the risk or institutional boundary of Attribution boundary?	9
Q15. Which statement uses Attribution boundary without changing its hazard, mandate or status?	9
Q16. Which option avoids the standard UPSC close-option trap about Attribution boundary?	9
Q17. Which statement correctly identifies Mitigation adaptation and DRR?	9
Q18. Which option preserves the risk or institutional boundary of Mitigation adaptation and DRR?	10
Q19. Which statement uses Mitigation adaptation and DRR without changing its hazard, mandate or status?	10
Q20. Which option avoids the standard UPSC close-option trap about Mitigation adaptation and DRR?	10
Q21. Which statement correctly identifies Incremental adaptation?	11
Q22. Which option preserves the risk or institutional boundary of Incremental adaptation?	11
Q23. Which statement uses Incremental adaptation without changing its hazard, mandate or status?	11
Q24. Which option avoids the standard UPSC close-option trap about Incremental adaptation?	11
Q25. Which statement correctly identifies Transformational adaptation?	12
Q26. Which option preserves the risk or institutional boundary of Transformational adaptation?	12
Q27. Which statement uses Transformational adaptation without changing its hazard, mandate or status?	12

Q28. Which option avoids the standard UPSC close-option trap about Transformational adaptation?	13
Q29. Which statement correctly identifies Maladaptation?	13
Q30. Which option preserves the risk or institutional boundary of Maladaptation?	13
Q31. Which statement uses Maladaptation without changing its hazard, mandate or status?	13
Q32. Which option avoids the standard UPSC close-option trap about Maladaptation?	14
Q33. Which statement correctly identifies Residual risk?	14
Q34. Which option preserves the risk or institutional boundary of Residual risk?	14
Q35. Which statement uses Residual risk without changing its hazard, mandate or status?	14
Q36. Which option avoids the standard UPSC close-option trap about Residual risk?	15
Q37. Which statement correctly identifies Limits to adaptation?	15
Q38. Which option preserves the risk or institutional boundary of Limits to adaptation?	15
Q39. Which statement uses Limits to adaptation without changing its hazard, mandate or status?	16
Q40. Which option avoids the standard UPSC close-option trap about Limits to adaptation?	16
Q41. Which statement correctly identifies Loss and damage?	16
Q42. Which option preserves the risk or institutional boundary of Loss and damage?	16
Q43. Which statement uses Loss and damage without changing its hazard, mandate or status?	17
Q44. Which option avoids the standard UPSC close-option trap about Loss and damage?	17
Q45. Which statement correctly identifies Avoid minimise address?	17
Q46. Which option preserves the risk or institutional boundary of Avoid minimise address?	18
Q47. Which statement uses Avoid minimise address without changing its hazard, mandate or status?	18
Q48. Which option avoids the standard UPSC close-option trap about Avoid minimise address?	18
Q49. Which statement correctly identifies Economic loss and damage?	18
Q50. Which option preserves the risk or institutional boundary of Economic loss and damage?	19
Q51. Which statement uses Economic loss and damage without changing its hazard, mandate or status?	19
Q52. Which option avoids the standard UPSC close-option trap about Economic loss and damage?	19
Q53. Which statement correctly identifies Non-economic loss and damage?	20
Q54. Which option preserves the risk or institutional boundary of Non-economic loss and damage?	20
Q55. Which statement uses Non-economic loss and damage without changing its hazard, mandate or status?	20
Q56. Which option avoids the standard UPSC close-option trap about Non-economic loss and damage?	21
Q57. Which statement correctly identifies Warsaw International Mechanism?	21
Q58. Which option preserves the risk or institutional boundary of Warsaw International Mechanism?	21
Q59. Which statement uses Warsaw International Mechanism without changing its hazard, mandate or status?	22

Q60. Which option avoids the standard UPSC close-option trap about Warsaw International Mechanism?	22
Q61. Which statement correctly identifies Santiago Network and fund status?	22
Q62. Which option preserves the risk or institutional boundary of Santiago Network and fund status?	23
Q63. Which statement uses Santiago Network and fund status without changing its hazard, mandate or status?	23
Q64. Which option avoids the standard UPSC close-option trap about Santiago Network and fund status?	23
Q65. Which statement correctly identifies Climate services?	24
Q66. Which option preserves the risk or institutional boundary of Climate services?	24
Q67. Which statement uses Climate services without changing its hazard, mandate or status?	24
Q68. Which option avoids the standard UPSC close-option trap about Climate services?	24
Q69. Which statement correctly identifies Locally led adaptation?	25
Q70. Which option preserves the risk or institutional boundary of Locally led adaptation?	25
Q71. Which statement uses Locally led adaptation without changing its hazard, mandate or status?	25
Q72. Which option avoids the standard UPSC close-option trap about Locally led adaptation?	26
Q73. Which statement correctly identifies Displacement and justice?	26
Q74. Which option preserves the risk or institutional boundary of Displacement and justice?	26
Q75. Which statement uses Displacement and justice without changing its hazard, mandate or status?	26
Q76. Which option avoids the standard UPSC close-option trap about Displacement and justice?	27
Q77. Which statement correctly identifies Mechanism-outcome firewall?	27
Q78. Which option preserves the risk or institutional boundary of Mechanism-outcome firewall?	27
Q79. Which statement uses Mechanism-outcome firewall without changing its hazard, mandate or status?	28
Q80. Which option avoids the standard UPSC close-option trap about Mechanism-outcome firewall?	28

Climate Risk, Adaptation and Loss and Damage - Solved Practice Workbook

BASIC MCQS / REMEDIATION

Q1. Which statement correctly identifies Climate disaster risk equation?

A. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. B. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. C. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. D. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence.

Answer: A. Explanation: Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q2. Which option preserves the risk or institutional boundary of Climate disaster risk equation?

A. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. B. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. C. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. D. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable.

Answer: B. Explanation: Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q3. Which statement uses Climate disaster risk equation without changing its hazard, mandate or status?

A. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. B. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. C. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. D. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses.

Answer: C. Explanation: Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q4. Which option avoids the standard UPSC close-option trap about Climate disaster risk equation?

A. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. B. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. C. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. D. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss.

Answer: D. Explanation: Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q5. Which statement correctly identifies Hazard exposure vulnerability?

A. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. B. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. C. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. D. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses.

Answer: A. Explanation: Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q6. Which option preserves the risk or institutional boundary of Hazard exposure vulnerability?

A. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. B. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. C. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. D. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses.

Answer: B. Explanation: Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q7. Which statement uses Hazard exposure vulnerability without changing its hazard, mandate or status?

A. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. B. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. C. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. D. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable.

Answer: C. Explanation: Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q8. Which option avoids the standard UPSC close-option trap about Hazard exposure vulnerability?

A. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. B. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. C. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. D. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated.

Answer: D. Explanation: Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q9. Which statement correctly identifies Climate variability and climate change?

A. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. B. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. C. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. D. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses.

Answer: A. Explanation: Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q10. Which option preserves the risk or institutional boundary of Climate variability and climate change?

A. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. B. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. C. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. D. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk,

for example changing land use, livelihoods, settlement patterns or governance arrangements.

Answer: B. Explanation: Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q11. Which statement uses Climate variability and climate change without changing its hazard, mandate or status?

A. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. B. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. C. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. D. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards.

Answer: C. Explanation: Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q12. Which option avoids the standard UPSC close-option trap about Climate variability and climate change?

A. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. B. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. C. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. D. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence.

Answer: D. Explanation: Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q13. Which statement correctly identifies Attribution boundary?

A. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. B. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. C. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. D. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards.

Answer: A. Explanation: Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q14. Which option preserves the risk or institutional boundary of Attribution boundary?

A. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. B. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. C. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. D. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit.

Answer: B. Explanation: Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q15. Which statement uses Attribution boundary without changing its hazard, mandate or status?

A. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. B. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. C. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. D. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible.

Answer: C. Explanation: Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q16. Which option avoids the standard UPSC close-option trap about Attribution boundary?

A. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. B. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. C. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. D. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses.

Answer: D. Explanation: Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q17. Which statement correctly identifies Mitigation adaptation and DRR?

A. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. B. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. C. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. D. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards.

Answer: A. Explanation: Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q18. Which option preserves the risk or institutional boundary of Mitigation adaptation and DRR?

A. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. B. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. C. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. D. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible.

Answer: B. Explanation: Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q19. Which statement uses Mitigation adaptation and DRR without changing its hazard, mandate or status?

A. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. B. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. C. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. D. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent.

Answer: C. Explanation: Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q20. Which option avoids the standard UPSC close-option trap about Mitigation adaptation and DRR?

A. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. B. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. C. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. D. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable.

Answer: D. Explanation: Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q21. Which statement correctly identifies Incremental adaptation?

A. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. B. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. C. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. D. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit.

Answer: A. Explanation: Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q22. Which option preserves the risk or institutional boundary of Incremental adaptation?

A. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. B. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. C. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. D. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit.

Answer: B. Explanation: Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q23. Which statement uses Incremental adaptation without changing its hazard, mandate or status?

A. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. B. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. C. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. D. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent.

Answer: C. Explanation: Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q24. Which option avoids the standard UPSC close-option trap about Incremental adaptation?

A. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. B. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. C. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. D. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards.

Answer: D. Explanation: Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. The other

options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q25. Which statement correctly identifies Transformational adaptation?

A. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. B. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. C. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. D. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible.

Answer: A. Explanation: Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q26. Which option preserves the risk or institutional boundary of Transformational adaptation?

A. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. B. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. C. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. D. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible.

Answer: B. Explanation: Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q27. Which statement uses Transformational adaptation without changing its hazard, mandate or status?

A. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. B. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. C. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. D. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project.

Answer: C. Explanation: Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q28. Which option avoids the standard UPSC close-option trap about Transformational adaptation?

A. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. B. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. C. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. D. Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements.

Answer: D. Explanation: Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q29. Which statement correctly identifies Maladaptation?

A. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. B. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. C. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. D. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent.

Answer: A. Explanation: Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q30. Which option preserves the risk or institutional boundary of Maladaptation?

A. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. B. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. C. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. D. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent.

Answer: B. Explanation: Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q31. Which statement uses Maladaptation without changing its hazard, mandate or status?

A. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. B. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. C. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. D. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage.

Answer: C. Explanation: Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. The other options change

the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q32. Which option avoids the standard UPSC close-option trap about Maladaptation?

A. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. B. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. C. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. D. Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit.

Answer: D. Explanation: Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q33. Which statement correctly identifies Residual risk?

A. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. B. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. C. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. D. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage.

Answer: A. Explanation: Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q34. Which option preserves the risk or institutional boundary of Residual risk?

A. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. B. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. C. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. D. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project.

Answer: B. Explanation: Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q35. Which statement uses Residual risk without changing its hazard, mandate or status?

A. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. B. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. C. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. D. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit.

Answer: C. Explanation: Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q36. Which option avoids the standard UPSC close-option trap about Residual risk?

A. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. B. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. C. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. D. Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible.

Answer: D. Explanation: Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q37. Which statement correctly identifies Limits to adaptation?

A. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. B. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. C. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. D. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage.

Answer: A. Explanation: A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q38. Which option preserves the risk or institutional boundary of Limits to adaptation?

A. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. B. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. C. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. D. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit.

Answer: B. Explanation: A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q39. Which statement uses Limits to adaptation without changing its hazard, mandate or status?

A. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. B. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. C. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. D. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit.

Answer: C. Explanation: A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q40. Which option avoids the standard UPSC close-option trap about Limits to adaptation?

A. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. B. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. C. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. D. A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent.

Answer: D. Explanation: A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q41. Which statement correctly identifies Loss and damage?

A. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. B. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. C. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. D. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage.

Answer: A. Explanation: Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q42. Which option preserves the risk or institutional boundary of Loss and damage?

A. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. B. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. C. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. D. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place.

Answer: B. Explanation: Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or

adaptation project. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q43. Which statement uses Loss and damage without changing its hazard, mandate or status?

- A. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. B. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. C. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. D. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation.

Answer: C. Explanation: Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q44. Which option avoids the standard UPSC close-option trap about Loss and damage?

- A. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. B. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. C. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. D. Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project.

Answer: D. Explanation: Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q45. Which statement correctly identifies Avoid minimise address?

- A. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. B. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. C. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. D. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit.

Answer: A. Explanation: The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q46. Which option preserves the risk or institutional boundary of Avoid minimise address?

A. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. B. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. C. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. D. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place.

Answer: B. Explanation: The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q47. Which statement uses Avoid minimise address without changing its hazard, mandate or status?

A. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. B. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. C. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. D. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome.

Answer: C. Explanation: The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q48. Which option avoids the standard UPSC close-option trap about Avoid minimise address?

A. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. B. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. C. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. D. The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage.

Answer: D. Explanation: The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q49. Which statement correctly identifies Economic loss and damage?

A. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. B. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. C. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. D. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place.

Answer: A. Explanation: Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q50. Which option preserves the risk or institutional boundary of Economic loss and damage?

A. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. B. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. C. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. D. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome.

Answer: B. Explanation: Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q51. Which statement uses Economic loss and damage without changing its hazard, mandate or status?

A. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. B. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. C. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. D. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions.

Answer: C. Explanation: Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q52. Which option avoids the standard UPSC close-option trap about Economic loss and damage?

A. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. B. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. C. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. D. Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit.

Answer: D. Explanation: Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q53. Which statement correctly identifies Non-economic loss and damage?

A. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. B. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. C. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. D. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome.

Answer: A. Explanation: Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q54. Which option preserves the risk or institutional boundary of Non-economic loss and damage?

A. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. B. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. C. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. D. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions.

Answer: B. Explanation: Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q55. Which statement uses Non-economic loss and damage without changing its hazard, mandate or status?

A. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. B. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. C. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. D. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome.

Answer: C. Explanation: Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q56. Which option avoids the standard UPSC close-option trap about Non-economic loss and damage?

A. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. B. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. C. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. D. Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation.

Answer: D. Explanation: Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q57. Which statement correctly identifies Warsaw International Mechanism?

A. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. B. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. C. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. D. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports.

Answer: A. Explanation: The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q58. Which option preserves the risk or institutional boundary of Warsaw International Mechanism?

A. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. B. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. C. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. D. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks.

Answer: B. Explanation: The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q59. Which statement uses Warsaw International Mechanism without changing its hazard, mandate or status?

A. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. B. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. C. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. D. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions.

Answer: C. Explanation: The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q60. Which option avoids the standard UPSC close-option trap about Warsaw International Mechanism?

A. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. B. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. C. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. D. The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place.

Answer: D. Explanation: The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q61. Which statement correctly identifies Santiago Network and fund status?

A. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. B. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. C. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. D. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome.

Answer: A. Explanation: The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q62. Which option preserves the risk or institutional boundary of Santiago Network and fund status?

A. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. B. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. C. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. D. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks.

Answer: B. Explanation: The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q63. Which statement uses Santiago Network and fund status without changing its hazard, mandate or status?

A. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. B. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. C. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. D. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks.

Answer: C. Explanation: The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q64. Which option avoids the standard UPSC close-option trap about Santiago Network and fund status?

A. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. B. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. C. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. D. The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports.

Answer: D. Explanation: The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q65. Which statement correctly identifies Climate services?

A. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. B. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. C. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. D. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence.

Answer: A. Explanation: Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q66. Which option preserves the risk or institutional boundary of Climate services?

A. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. B. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. C. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. D. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence.

Answer: B. Explanation: Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q67. Which statement uses Climate services without changing its hazard, mandate or status?

A. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. B. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. C. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. D. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated.

Answer: C. Explanation: Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q68. Which option avoids the standard UPSC close-option trap about Climate services?

A. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. B. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. C. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. D. Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome.

Answer: D. Explanation: Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q69. Which statement correctly identifies Locally led adaptation?

A. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. B. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. C. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. D. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence.

Answer: A. Explanation: Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q70. Which option preserves the risk or institutional boundary of Locally led adaptation?

A. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. B. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. C. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. D. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss.

Answer: B. Explanation: Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q71. Which statement uses Locally led adaptation without changing its hazard, mandate or status?

A. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. B. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. C. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. D. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence.

Answer: C. Explanation: Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q72. Which option avoids the standard UPSC close-option trap about Locally led adaptation?

A. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. B. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. C. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. D. Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions.

Answer: D. Explanation: Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q73. Which statement correctly identifies Displacement and justice?

A. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. B. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. C. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. D. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss.

Answer: A. Explanation: Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q74. Which option preserves the risk or institutional boundary of Displacement and justice?

A. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. B. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. C. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. D. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated.

Answer: B. Explanation: Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q75. Which statement uses Displacement and justice without changing its hazard, mandate or status?

A. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. B. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. C. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. D. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why

that event produced losses.

Answer: C. Explanation: Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q76. Which option avoids the standard UPSC close-option trap about Displacement and justice?

A. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. B. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. C. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. D. Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks.

Answer: D. Explanation: Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q77. Which statement correctly identifies Mechanism-outcome firewall?

A. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. B. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. C. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. D. Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss.

Answer: A. Explanation: A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q78. Which option preserves the risk or institutional boundary of Mechanism-outcome firewall?

A. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. B. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. C. Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. D. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence.

Answer: B. Explanation: A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q79. Which statement uses Mechanism-outcome firewall without changing its hazard, mandate or status?

A. Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. B. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. C. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. D. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses.

Answer: C. Explanation: A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

Q80. Which option avoids the standard UPSC close-option trap about Mechanism-outcome firewall?

A. Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. B. Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. C. Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. D. A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence.

Answer: D. Explanation: A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. The other options change the hazard or risk category, institutional owner, legal instrument, warning stage, evidence rung or implementation status.

PYQS AND ANSWER PRACTICE

AUDITED TOPIC-SPECIFIC PYQ OWNERSHIP

No audited 2024-2025 GS-III question directly owns the full topic. The 2024 urban-flood and resilience questions are bounded applications; the 2025 Paris question remains Environment/UNFCCC-owned and adjacent only.

PYQ DEMAND CARD 1 - 2024 GS-III

Demand: Discuss urban flooding as a climate-induced disaster and the policies and frameworks in India that aim at tackling it.

Status: Verified climate-risk application but Topic 08-owned; this card contributes attribution discipline, adaptation/DRR distinction, climate services and maladaptation safeguards.

Model solution: Climate disaster risk equation: Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. **Hazard exposure vulnerability:** Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. **Climate variability and climate change:** Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. **Attribution boundary:** Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. **Mitigation adaptation and**

DRR: Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. **Maladaptation:** Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. **Climate services:** Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. **Mechanism-outcome firewall:** A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. The solution therefore answers the routed demand without inventing an official model answer or an objective answer key.

PYQ DEMAND CARD 2 - 2024 GS-III

Demand: Describe disaster resilience, how it is determined and the elements of the Sendai Framework.

Status: Verified support route: climate risk, adaptation pathways, residual risk and local capacity illustrate resilience without converting Sendai into a climate treaty.

Model solution: Climate disaster risk equation: Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. **Hazard exposure vulnerability:** Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. **Mitigation adaptation and DRR:** Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. **Incremental adaptation:** Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. **Transformational adaptation:** Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. **Maladaptation:** Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. **Residual risk:** Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. **Climate services:** Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. **Locally led adaptation:** Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. **Mechanism-outcome firewall:** A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. The solution therefore answers the routed demand without inventing an official model answer or an objective answer key.

PYQ DEMAND CARD 3 - 2025 GS-III

Demand: Review India's climate commitments under the Paris Agreement and the strengthening announced at COP26.

Status: Verified adjacent Environment/UNFCCC-owned route; this card supplies only adaptation, attribution and loss-and-damage distinctions and does not absorb NDC or mitigation-commitment detail.

Model solution: Climate variability and climate change: Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. **Attribution boundary:** Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. **Mitigation adaptation and DRR:** Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. **Residual risk:** Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. **Loss and damage:** Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and

adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. **Avoid minimise address:** The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. **Warsaw International Mechanism:** The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. **Santiago Network and fund status:** The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. **Mechanism-outcome firewall:** A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. The solution therefore answers the routed demand without inventing an official model answer or an objective answer key.

ORIGINAL MAINS 1 - 10 MARKS

Question: Distinguish hazard, exposure, vulnerability and climate-change attribution. Answer in about 150 words.

Model thesis: Claim: Climate disaster risk equation. **Named evidence/example:** Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Hazard exposure vulnerability. **Named evidence/example:** Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Climate variability and climate change. **Named evidence/example:** Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Attribution boundary. **Named evidence/example:** Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary.

Claim -> named evidence -> analysis -> qualification:

- Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss.
- Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated.
- Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence.
- Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses.

Qualified conclusion: Claim: Climate disaster risk equation. **Named evidence/example:** Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Hazard exposure vulnerability. **Named evidence/example:** Hazard is the potentially damaging event or trend, exposure is what is

located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Climate variability and climate change. **Named evidence/example:** Climate variability describes fluctuations across seasons, years or longer natural modes, whereas anthropogenic climate change is a long-term human-influenced shift; a single event must not be attributed to either without appropriate evidence. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Attribution boundary. **Named evidence/example:** Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary.

ORIGINAL MAINS 2 - 10 MARKS

Question: Differentiate mitigation, adaptation, disaster risk reduction and loss and damage. Answer in about 150 words.

Model thesis: Claim: Mitigation adaptation and DRR. **Named evidence/example:** Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Residual risk. **Named evidence/example:** Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Loss and damage. **Named evidence/example:** Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Avoid minimise address. **Named evidence/example:** The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary.

Claim -> named evidence -> analysis -> qualification:

- Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable.
- Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible.
- Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project.
- The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage.

Qualified conclusion: Claim: Mitigation adaptation and DRR. **Named evidence/example:** Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable.

Analysis: This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Residual risk. **Named evidence/example:** Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Loss and damage. **Named evidence/example:** Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Avoid minimise address. **Named evidence/example:** The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary.

ORIGINAL MAINS 3 - 15 MARKS

Question: Explain incremental and transformational adaptation, maladaptation and limits to adaptation. Answer in about 250 words.

Model thesis: **Claim:** Incremental adaptation. **Named evidence/example:** Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Transformational adaptation. **Named evidence/example:** Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Maladaptation. **Named evidence/example:** Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Residual risk. **Named evidence/example:** Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Limits to adaptation. **Named evidence/example:** A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary.

Claim -> named evidence -> analysis -> qualification:

- Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards.
- Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements.

- Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit.
- Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible.
- A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent.

Qualified conclusion: **Claim:** Incremental adaptation. **Named evidence/example:** Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Transformational adaptation. **Named evidence/example:** Transformational adaptation changes fundamental attributes of a system when incremental measures cannot maintain acceptable risk, for example changing land use, livelihoods, settlement patterns or governance arrangements. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Maladaptation. **Named evidence/example:** Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Residual risk. **Named evidence/example:** Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Limits to adaptation. **Named evidence/example:** A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary.

ORIGINAL MAINS 4 - 15 MARKS

Question: Analyse economic and non-economic loss and damage through the avoid-minimise-address framework. Answer in about 250 words.

Model thesis: **Claim:** Loss and damage. **Named evidence/example:** Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Avoid minimise address. **Named evidence/example:** The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Economic loss and damage. **Named evidence/example:** Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Non-economic loss and damage. **Named evidence/example:** Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy

implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Displacement and justice. **Named evidence/example:** Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary.

Claim -> named evidence -> analysis -> qualification:

- Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project.
- The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage.
- Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit.
- Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation.
- Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks.

Qualified conclusion: **Claim:** Loss and damage. **Named evidence/example:** Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Avoid minimise address. **Named evidence/example:** The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Economic loss and damage. **Named evidence/example:** Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Non-economic loss and damage. **Named evidence/example:** Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Displacement and justice. **Named evidence/example:** Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary.

ORIGINAL MAINS 5 - 20 MARKS

Question: Design a climate-risk governance framework integrating climate services, locally led adaptation and residual-risk protection. Answer in about 300 words.

Model thesis: **Claim:** Climate disaster risk equation. **Named evidence/example:** Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Hazard exposure vulnerability. **Named evidence/example:** Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Attribution boundary. **Named evidence/example:** Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Mitigation adaptation and DRR. **Named evidence/example:** Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Incremental adaptation. **Named evidence/example:** Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Maladaptation. **Named evidence/example:** Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Residual risk. **Named evidence/example:** Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Limits to adaptation. **Named evidence/example:** A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Climate services. **Named evidence/example:** Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Locally led adaptation. **Named evidence/example:** Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Displacement and justice. **Named evidence/example:** Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are

not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Mechanism-outcome firewall. **Named evidence/example:** A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary.

Claim -> named evidence -> analysis -> qualification:

- Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss.
- Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated.
- Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses.
- Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable.
- Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards.
- Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit.
- Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible.
- A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent.
- Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome.
- Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions.
- Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks.
- A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence.

Qualified conclusion: **Claim:** Climate disaster risk equation. **Named evidence/example:** Climate-related disaster risk arises from the interaction of a hazard with exposure, vulnerability and capacity; a stronger climate signal does not by itself determine disaster loss. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Hazard exposure vulnerability. **Named evidence/example:** Hazard is the potentially damaging event or trend, exposure is what is located in harm's way, and vulnerability is susceptibility to harm; policies can change the latter two even when the hazard cannot be eliminated. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Attribution boundary. **Named evidence/example:** Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and

verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Mitigation adaptation and DRR. **Named evidence/example:** Climate mitigation reduces greenhouse-gas-driven future change, adaptation adjusts systems to actual or expected impacts, and disaster risk reduction manages existing and prospective disaster risk; they overlap but are not interchangeable. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Incremental adaptation. **Named evidence/example:** Incremental adaptation maintains the basic system while reducing risk through adjustments such as improved warnings, water efficiency, heat plans or protective standards. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Maladaptation. **Named evidence/example:** Maladaptation is an intervention that increases risk, emissions, inequality or future lock-in for some people, places or periods even if it produces a short-term benefit. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Residual risk. **Named evidence/example:** Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Limits to adaptation. **Named evidence/example:** A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Climate services. **Named evidence/example:** Climate services translate climate data, monitoring, forecasts and projections into usable information through co-design, communication and feedback; a model output alone is not a service or an adaptation outcome. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Locally led adaptation. **Named evidence/example:** Locally led adaptation gives affected people meaningful decision power, predictable resources, accessible information and accountability while connecting local knowledge with technical and public institutions. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Displacement and justice. **Named evidence/example:** Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Mechanism-outcome firewall. **Named evidence/example:** A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary.

ORIGINAL MAINS 6 - 20 MARKS

Question: Critically evaluate whether current loss-and-damage institutions can address climate justice without causal and status overclaiming. Answer in about 300 words.

Model thesis: **Claim:** Attribution boundary. **Named evidence/example:** Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Residual risk. **Named evidence/example:** Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Limits to adaptation. **Named evidence/example:** A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Loss and damage. **Named evidence/example:** Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Avoid minimise address. **Named evidence/example:** The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Economic loss and damage. **Named evidence/example:** Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Non-economic loss and damage. **Named evidence/example:** Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Warsaw International Mechanism. **Named evidence/example:** The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Santiago Network and fund status. **Named evidence/example:** The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Displacement and justice. **Named evidence/example:** Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Mechanism-outcome firewall. **Named evidence/example:**

A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary.

Claim -> named evidence -> analysis -> qualification:

- Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses.
- Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible.
- A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent.
- Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project.
- The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage.
- Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit.
- Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation.
- The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place.
- The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports.
- Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks.
- A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence.

Qualified conclusion: Claim: Attribution boundary. **Named evidence/example:** Trend attribution, event attribution and disaster-loss attribution answer different questions: whether climate changed a hazard, whether it affected a particular event's likelihood or intensity, and why that event produced losses. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication.

Qualification: The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Residual risk. **Named evidence/example:** Residual risk is the risk remaining after feasible mitigation, adaptation and DRR measures; its existence does not mean no further preparedness, protection or finance is possible. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Limits to adaptation. **Named evidence/example:** A soft limit may be overcome through finance, technology, institutions or knowledge, while a hard limit cannot be avoided through adaptation within the system considered; limits are context-specific and evidence-dependent. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Loss and damage. **Named evidence/example:** Loss and damage concerns adverse climate impacts that are not or cannot be fully avoided through mitigation and adaptation; it is not a synonym for every disaster loss, relief payment or adaptation project. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date,

institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Avoid minimise address. **Named evidence/example:** The UNFCCC loss-and-damage grammar distinguishes averting future loss, minimising unavoidable loss and addressing realised or residual impacts; each verb points to a different policy stage. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Economic loss and damage. **Named evidence/example:** Economic loss and damage can be expressed in monetary terms, including damaged assets, production and income, while valuation method and baseline must remain explicit. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Non-economic loss and damage. **Named evidence/example:** Non-economic loss and damage includes harms such as life, health, culture, identity, territory, biodiversity and social cohesion that may not be adequately represented by market valuation. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Warsaw International Mechanism. **Named evidence/example:** The Warsaw International Mechanism was established under the UNFCCC loss-and-damage architecture to enhance knowledge, coordination and action and support; its existence does not prove delivery in a particular place. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Santiago Network and fund status. **Named evidence/example:** The Santiago Network and the Fund for Responding to Loss and Damage belong to later institutional layers whose governance, access and operational status must be stated only from dated UNFCCC decisions and reports. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Displacement and justice. **Named evidence/example:** Climate-related displacement can be temporary, prolonged, internal or cross-border; disaster-displaced persons are not automatically refugees, and protection must be analysed through applicable domestic, human-rights and humanitarian frameworks. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary. **Claim:** Mechanism-outcome firewall. **Named evidence/example:** A plan, NAP, climate service, dialogue, network, fund decision or adaptation project proves its own status only; reduced vulnerability, avoided loss, equitable access and successful relocation require separate evidence. **Analysis:** This fixes the hazard, risk or protection category, institutional mandate and verified evidence rung before drawing the policy implication. **Qualification:** The conclusion retains the owner's date, institution, legal character and the mandate-to-implementation-to-outcome boundary.
