

SOLVED PRACTICE WORKBOOK

Food Processing, Cold Chains and Value Addition - Learner-v2 Refreshed

UPSC complete learning session | Foundation to advanced | Concepts, evidence, practice and answer writing

Original deterministic study visual; labels are explanatory, not textual quotations.

Source order: repository knowledge -> official current linkage -> clearly marked analysis. No fabricated PYQs or statistics.

CONTENTS / WORKBOOK INDEX

Major learning parts and meaningful subtopics are listed in document order. Page numbers are generated from the final PDF layout; PDF bookmarks mirror the same hierarchy.

Food Processing, Cold Chains and Value Addition - Solved Practice Workbook 6

BASIC MCQS / REMEDIATION 6

Q1. Which statement correctly identifies Food processing?	6
Q2. Which option preserves the accounting or regulatory boundary of Food processing?	6
Q3. Which statement uses Food processing without losing its vintage, basket or legal status?	6
Q4. Which option avoids the standard UPSC close-option trap about Food processing?	6
Q5. Which statement correctly identifies Cold chain?	7
Q6. Which option preserves the accounting or regulatory boundary of Cold chain?	7
Q7. Which statement uses Cold chain without losing its vintage, basket or legal status?	7
Q8. Which option avoids the standard UPSC close-option trap about Cold chain?	7
Q9. Which statement correctly identifies Value addition?	8
Q10. Which option preserves the accounting or regulatory boundary of Value addition?	8
Q11. Which statement uses Value addition without losing its vintage, basket or legal status?	8
Q12. Which option avoids the standard UPSC close-option trap about Value addition?	8
Q13. Which statement correctly identifies Post-harvest management?	9
Q14. Which option preserves the accounting or regulatory boundary of Post-harvest management?	9
Q15. Which statement uses Post-harvest management without losing its vintage, basket or legal status?	9
Q16. Which option avoids the standard UPSC close-option trap about Post-harvest management?	9
Q17. Which statement correctly identifies Traceability?	10
Q18. Which option preserves the accounting or regulatory boundary of Traceability?	10
Q19. Which statement uses Traceability without losing its vintage, basket or legal status?	10
Q20. Which option avoids the standard UPSC close-option trap about Traceability?	10
Q21. Which statement correctly identifies PM Kisan SAMPADA?	11
Q22. Which option preserves the accounting or regulatory boundary of PM Kisan SAMPADA?	11
Q23. Which statement uses PM Kisan SAMPADA without losing its vintage, basket or legal status?	11
Q24. Which option avoids the standard UPSC close-option trap about PM Kisan SAMPADA?	11
Q25. Which statement correctly identifies Integrated cold-chain nodes?	12
Q26. Which option preserves the accounting or regulatory boundary of Integrated cold-chain nodes?	12
Q27. Which statement uses Integrated cold-chain nodes without losing its vintage, basket or legal status?	12

Q28. Which option avoids the standard UPSC close-option trap about Integrated cold-chain nodes?	13
Q29. Which statement correctly identifies Operation Greens boundary?	13
Q30. Which option preserves the accounting or regulatory boundary of Operation Greens boundary?	13
Q31. Which statement uses Operation Greens boundary without losing its vintage, basket or legal status?	13
Q32. Which option avoids the standard UPSC close-option trap about Operation Greens boundary?	14
Q33. Which statement correctly identifies PLISFPI boundary?	14
Q34. Which option preserves the accounting or regulatory boundary of PLISFPI boundary?	14
Q35. Which statement uses PLISFPI boundary without losing its vintage, basket or legal status?	14
Q36. Which option avoids the standard UPSC close-option trap about PLISFPI boundary?	15
Q37. Which statement correctly identifies Mega Food Park model?	15
Q38. Which option preserves the accounting or regulatory boundary of Mega Food Park model?	15
Q39. Which statement uses Mega Food Park model without losing its vintage, basket or legal status?	15
Q40. Which option avoids the standard UPSC close-option trap about Mega Food Park model?	16
Q41. Which statement correctly identifies Capacity utilisation?	16
Q42. Which option preserves the accounting or regulatory boundary of Capacity utilisation?	16
Q43. Which statement uses Capacity utilisation without losing its vintage, basket or legal status?	16
Q44. Which option avoids the standard UPSC close-option trap about Capacity utilisation?	17
Q45. Which statement correctly identifies FSSAI and APEDA?	17
Q46. Which option preserves the accounting or regulatory boundary of FSSAI and APEDA?	17
Q47. Which statement uses FSSAI and APEDA without losing its vintage, basket or legal status?	17
Q48. Which option avoids the standard UPSC close-option trap about FSSAI and APEDA?	18
Q49. Which statement correctly identifies Standards and SPS?	18
Q50. Which option preserves the accounting or regulatory boundary of Standards and SPS?	18
Q51. Which statement uses Standards and SPS without losing its vintage, basket or legal status?	18
Q52. Which option avoids the standard UPSC close-option trap about Standards and SPS?	19
Q53. Which statement correctly identifies Backward and forward links?	19
Q54. Which option preserves the accounting or regulatory boundary of Backward and forward links?	19
Q55. Which statement uses Backward and forward links without losing its vintage, basket or legal status?	19
Q56. Which option avoids the standard UPSC close-option trap about Backward and forward links?	20
Q57. Which statement correctly identifies Contract and margin distribution?	20
Q58. Which option preserves the accounting or regulatory boundary of Contract and margin distribution?	20
Q59. Which statement uses Contract and margin distribution without losing its vintage, basket or legal status?	20

Q60. Which option avoids the standard UPSC close-option trap about Contract and margin distribution?	21
Q61. Which statement correctly identifies Employment nodes?	21
Q62. Which option preserves the accounting or regulatory boundary of Employment nodes?	21
Q63. Which statement uses Employment nodes without losing its vintage, basket or legal status?	21
Q64. Which option avoids the standard UPSC close-option trap about Employment nodes?	22
Q65. Which statement correctly identifies Small-processor constraints?	22
Q66. Which option preserves the accounting or regulatory boundary of Small-processor constraints?	22
Q67. Which statement uses Small-processor constraints without losing its vintage, basket or legal status?	22
Q68. Which option avoids the standard UPSC close-option trap about Small-processor constraints?	23
Q69. Which statement correctly identifies By-product use?	23
Q70. Which option preserves the accounting or regulatory boundary of By-product use?	23
Q71. Which statement uses By-product use without losing its vintage, basket or legal status?	23
Q72. Which option avoids the standard UPSC close-option trap about By-product use?	24
Q73. Which statement correctly identifies Capacity versus value realised?	24
Q74. Which option preserves the accounting or regulatory boundary of Capacity versus value realised?	24
Q75. Which statement uses Capacity versus value realised without losing its vintage, basket or legal status?	24
Q76. Which option avoids the standard UPSC close-option trap about Capacity versus value realised?	25
Q77. Which statement correctly identifies PYQ routing boundary?	25
Q78. Which option preserves the accounting or regulatory boundary of PYQ routing boundary?	25
Q79. Which statement uses PYQ routing boundary without losing its vintage, basket or legal status?	25
Q80. Which option avoids the standard UPSC close-option trap about PYQ routing boundary?	26

Food Processing, Cold Chains and Value Addition - Solved Practice Workbook

BASIC MCQS / REMEDIATION

Q1. Which statement correctly identifies Food processing?

A. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. B. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. C. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. D. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain.

Answer: A. Explanation: Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q2. Which option preserves the accounting or regulatory boundary of Food processing?

A. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. B. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. C. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. D. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself.

Answer: B. Explanation: Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q3. Which statement uses Food processing without losing its vintage, basket or legal status?

A. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. B. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. C. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. D. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline.

Answer: C. Explanation: Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q4. Which option avoids the standard UPSC close-option trap about Food processing?

A. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. B. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. C. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. D. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant.

Answer: D. Explanation: Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q5. Which statement correctly identifies Cold chain?

A. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. B. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. C. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. D. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself.

Answer: A. Explanation: A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q6. Which option preserves the accounting or regulatory boundary of Cold chain?

A. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. B. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. C. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. D. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself.

Answer: B. Explanation: A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q7. Which statement uses Cold chain without losing its vintage, basket or legal status?

A. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. B. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. C. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. D. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline.

Answer: C. Explanation: A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q8. Which option avoids the standard UPSC close-option trap about Cold chain?

A. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. B. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. C. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. D. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain.

Answer: D. Explanation: A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q9. Which statement correctly identifies Value addition?

A. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. B. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. C. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. D. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself.

Answer: A. Explanation: Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q10. Which option preserves the accounting or regulatory boundary of Value addition?

A. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. B. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. C. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. D. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity.

Answer: B. Explanation: Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q11. Which statement uses Value addition without losing its vintage, basket or legal status?

A. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. B. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. C. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. D. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline.

Answer: C. Explanation: Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q12. Which option avoids the standard UPSC close-option trap about Value addition?

A. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. B. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. C. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursement and realised exports are different stages. D. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain.

Answer: D. Explanation: Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q13. Which statement correctly identifies Post-harvest management?

A. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. B. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. C. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. D. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline.

Answer: A. Explanation: Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q14. Which option preserves the accounting or regulatory boundary of Post-harvest management?

A. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. B. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. C. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. D. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity.

Answer: B. Explanation: Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q15. Which statement uses Post-harvest management without losing its vintage, basket or legal status?

A. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. B. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. C. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. D. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursement and realised exports are different stages.

Answer: C. Explanation: Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q16. Which option avoids the standard UPSC close-option trap about Post-harvest management?

A. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. B. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursement and realised exports are different stages. C. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. D. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest.

Answer: D. Explanation: Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q17. Which statement correctly identifies Traceability?

A. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. B. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. C. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. D. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity.

Answer: A. Explanation: Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q18. Which option preserves the accounting or regulatory boundary of Traceability?

A. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages. B. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. C. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. D. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal.

Answer: B. Explanation: Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q19. Which statement uses Traceability without losing its vintage, basket or legal status?

A. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages. B. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. C. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. D. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal.

Answer: C. Explanation: Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q20. Which option avoids the standard UPSC close-option trap about Traceability?

A. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages. B. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. C. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. D. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself.

Answer: D. Explanation: Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q21. Which statement correctly identifies PM Kisan SAMPADA?

A. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. B. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. C. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. D. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages.

Answer: A. Explanation: Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q22. Which option preserves the accounting or regulatory boundary of PM Kisan SAMPADA?

A. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. B. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. C. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. D. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages.

Answer: B. Explanation: Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q23. Which statement uses PM Kisan SAMPADA without losing its vintage, basket or legal status?

A. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. B. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages. C. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. D. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability.

Answer: C. Explanation: Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q24. Which option avoids the standard UPSC close-option trap about PM Kisan SAMPADA?

A. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. B. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. C. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. D. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline.

Answer: D. Explanation: Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q25. Which statement correctly identifies Integrated cold-chain nodes?

A. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. B. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. C. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. D. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages.

Answer: A. Explanation: An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q26. Which option preserves the accounting or regulatory boundary of Integrated cold-chain nodes?

A. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. B. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. C. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages. D. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability.

Answer: B. Explanation: An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q27. Which statement uses Integrated cold-chain nodes without losing its vintage, basket or legal status?

A. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. B. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. C. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. D. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability.

Answer: C. Explanation: An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q28. Which option avoids the standard UPSC close-option trap about Integrated cold-chain nodes?

A. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. B. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. C. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. D. An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity.

Answer: D. Explanation: An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q29. Which statement correctly identifies Operation Greens boundary?

A. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. B. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. C. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursement and realised exports are different stages. D. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability.

Answer: A. Explanation: Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q30. Which option preserves the accounting or regulatory boundary of Operation Greens boundary?

A. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. B. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. C. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. D. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow.

Answer: B. Explanation: Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q31. Which statement uses Operation Greens boundary without losing its vintage, basket or legal status?

A. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. B. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. C. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. D. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors.

Answer: C. Explanation: Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. The

other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q32. Which option avoids the standard UPSC close-option trap about Operation Greens boundary?

A. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. B. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. C. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. D. Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal.

Answer: D. Explanation: Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q33. Which statement correctly identifies PLISFPI boundary?

A. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages. B. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. C. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. D. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability.

Answer: A. Explanation: The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q34. Which option preserves the accounting or regulatory boundary of PLISFPI boundary?

A. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. B. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages. C. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. D. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable.

Answer: B. Explanation: The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q35. Which statement uses PLISFPI boundary without losing its vintage, basket or legal status?

A. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. B. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. C. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages. D. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable.

Answer: C. Explanation: The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised

exports are different stages. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q36. Which option avoids the standard UPSC close-option trap about PLISFPI boundary?

A. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. B. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. C. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. D. The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursement and realised exports are different stages.

Answer: D. Explanation: The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursement and realised exports are different stages. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q37. Which statement correctly identifies Mega Food Park model?

A. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. B. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. C. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. D. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow.

Answer: A. Explanation: The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q38. Which option preserves the accounting or regulatory boundary of Mega Food Park model?

A. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. B. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. C. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. D. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors.

Answer: B. Explanation: The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q39. Which statement uses Mega Food Park model without losing its vintage, basket or legal status?

A. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. B. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. C. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. D. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers.

Answer: C. Explanation: The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q40. Which option avoids the standard UPSC close-option trap about Mega Food Park model?

A. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. B. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. C. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. D. The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability.

Answer: D. Explanation: The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q41. Which statement correctly identifies Capacity utilisation?

A. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. B. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. C. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. D. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports.

Answer: A. Explanation: Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q42. Which option preserves the accounting or regulatory boundary of Capacity utilisation?

A. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. B. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. C. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. D. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports.

Answer: B. Explanation: Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q43. Which statement uses Capacity utilisation without losing its vintage, basket or legal status?

A. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. B. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. C. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. D. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports.

Answer: C. Explanation: Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. The other

options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q44. Which option avoids the standard UPSC close-option trap about Capacity utilisation?

A. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. B. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. C. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. D. Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow.

Answer: D. Explanation: Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q45. Which statement correctly identifies FSSAI and APEDA?

A. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. B. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. C. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. D. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports.

Answer: A. Explanation: FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q46. Which option preserves the accounting or regulatory boundary of FSSAI and APEDA?

A. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. B. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. C. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. D. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately.

Answer: B. Explanation: FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q47. Which statement uses FSSAI and APEDA without losing its vintage, basket or legal status?

A. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. B. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. C. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. D. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists.

Answer: C. Explanation: FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q48. Which option avoids the standard UPSC close-option trap about FSSAI and APEDA?

A. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. B. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. C. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. D. FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable.

Answer: D. Explanation: FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q49. Which statement correctly identifies Standards and SPS?

A. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. B. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. C. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. D. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers.

Answer: A. Explanation: Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q50. Which option preserves the accounting or regulatory boundary of Standards and SPS?

A. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. B. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. C. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. D. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers.

Answer: B. Explanation: Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q51. Which statement uses Standards and SPS without losing its vintage, basket or legal status?

A. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. B. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. C. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. D. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets.

Answer: C. Explanation: Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q52. Which option avoids the standard UPSC close-option trap about Standards and SPS?

A. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. B. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. C. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. D. Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors.

Answer: D. Explanation: Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q53. Which statement correctly identifies Backward and forward links?

A. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. B. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. C. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. D. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers.

Answer: A. Explanation: Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q54. Which option preserves the accounting or regulatory boundary of Backward and forward links?

A. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. B. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. C. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. D. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately.

Answer: B. Explanation: Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q55. Which statement uses Backward and forward links without losing its vintage, basket or legal status?

A. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. B. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. C. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. D. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets.

Answer: C. Explanation: Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q56. Which option avoids the standard UPSC close-option trap about Backward and forward links?

A. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. B. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. C. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. D. Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports.

Answer: D. Explanation: Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q57. Which statement correctly identifies Contract and margin distribution?

A. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. B. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. C. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. D. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists.

Answer: A. Explanation: Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q58. Which option preserves the accounting or regulatory boundary of Contract and margin distribution?

A. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. B. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. C. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. D. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins.

Answer: B. Explanation: Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q59. Which statement uses Contract and margin distribution without losing its vintage, basket or legal status?

A. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. B. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. C. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. D. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins.

Answer: C. Explanation: Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q60. Which option avoids the standard UPSC close-option trap about Contract and margin distribution?

A. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. B. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. C. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. D. Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers.

Answer: D. Explanation: Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q61. Which statement correctly identifies Employment nodes?

A. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. B. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. C. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. D. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets.

Answer: A. Explanation: Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q62. Which option preserves the accounting or regulatory boundary of Employment nodes?

A. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. B. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. C. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. D. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets.

Answer: B. Explanation: Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q63. Which statement uses Employment nodes without losing its vintage, basket or legal status?

A. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. B. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. C. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. D. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions.

Answer: C. Explanation: Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q64. Which option avoids the standard UPSC close-option trap about Employment nodes?

A. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. B. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. C. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. D. Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately.

Answer: D. Explanation: Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q65. Which statement correctly identifies Small-processor constraints?

A. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. B. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. C. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. D. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets.

Answer: A. Explanation: Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q66. Which option preserves the accounting or regulatory boundary of Small-processor constraints?

A. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. B. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. C. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. D. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins.

Answer: B. Explanation: Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q67. Which statement uses Small-processor constraints without losing its vintage, basket or legal status?

A. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. B. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. C. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. D. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant.

Answer: C. Explanation: Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q68. Which option avoids the standard UPSC close-option trap about Small-processor constraints?

A. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. B. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. C. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. D. Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists.

Answer: D. Explanation: Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q69. Which statement correctly identifies By-product use?

A. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. B. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. C. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. D. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins.

Answer: A. Explanation: Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q70. Which option preserves the accounting or regulatory boundary of By-product use?

A. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. B. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. C. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. D. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant.

Answer: B. Explanation: Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q71. Which statement uses By-product use without losing its vintage, basket or legal status?

A. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. B. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. C. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. D. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain.

Answer: C. Explanation: Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q72. Which option avoids the standard UPSC close-option trap about By-product use?

A. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. B. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. C. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. D. Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets.

Answer: D. Explanation: Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q73. Which statement correctly identifies Capacity versus value realised?

A. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. B. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. C. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. D. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant.

Answer: A. Explanation: Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q74. Which option preserves the accounting or regulatory boundary of Capacity versus value realised?

A. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. B. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. C. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. D. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain.

Answer: B. Explanation: Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q75. Which statement uses Capacity versus value realised without losing its vintage, basket or legal status?

A. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. B. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. C. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. D. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest.

Answer: C. Explanation: Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q76. Which option avoids the standard UPSC close-option trap about Capacity versus value realised?

A. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. B. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. C. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. D. Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins.

Answer: D. Explanation: Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q77. Which statement correctly identifies PYQ routing boundary?

A. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. B. Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. C. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. D. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain.

Answer: A. Explanation: Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q78. Which option preserves the accounting or regulatory boundary of PYQ routing boundary?

A. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. B. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. C. A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. D. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain.

Answer: B. Explanation: Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q79. Which statement uses PYQ routing boundary without losing its vintage, basket or legal status?

A. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. B. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. C. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. D. Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain.

Answer: C. Explanation: Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned

with crop missions. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

Q80. Which option avoids the standard UPSC close-option trap about PYQ routing boundary?

A. Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. B. Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. C. Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. D. Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions.

Answer: D. Explanation: Verified PYQs test sector scope, policy, farmer income, employment and the cold-chain distinction; the routed palm-oil objective demand remains answer-key neutral and cross-owned with crop missions. The other options belong to different measures, vintages, baskets, instruments, institutions or legal perimeters.

PYQS AND ANSWER PRACTICE

VERIFIED PYQ OWNERSHIP AUDIT

Audited ledgers route Mains demands on government policy, food-processing challenges and opportunities, farmer income, sector scope and employment generation. The objective palm-oil demand is cross-routed and answer-key neutral; no origin, use or biodiesel option is inferred.

OWNER PYQ LEDGER EXTRACTS

9. PYQ application

- ANALYSIS: 2025 GS-III: Scope of food-processing industries and employment-generation measures.
- ANALYSIS: 2025 GS-III supply-chain question provides the upstream framework for processing answers.
- ANALYSIS: **2025 answer route:** cover scope from aggregation and primary processing to packaging, testing, cold logistics, retail and exports; then assess jobs at each node, not just factory employment.

Recent PYQ Integration (2024-2025)

Status: 2024-2025 question-level PYQ demand is integrated into this owner. **Provenance:** Audited local official-paper routing ledgers: _PYQ-ROUTING-MAINS-GS3-GS4-2024-2025.md.

- **Years represented:** 2025
- **Paper(s):** GS-III
- **Routed question demands:** 1

Year	Paper	Q	PYQ demand (neutral rendering)	Directive / format	Source status	Owner requirement
2025	GS-III	14	Scope of food-processing industries and employment generation	Examine · 15 marks · 250 words	Routed to owning topic	Prepare context, core dimensions, evidence/examples, counterpoint and a concise conclusion.

What this owner must now support

- Scope of food-processing industries and employment generation

This block integrates the 2024-2025 examinable demand and paper metadata. It is kept separate from the 2018-2023 block and does not convert an unkeyed/answer-free objective question into a solved answer.

Historical PYQ Integration (2018-2023)

Status: Question-level PYQ demand is integrated into this owner. **Provenance:** Audited local official-paper routing ledgers: _PYQ-ROUTING-MAINS-GS3-GS4-2018-2023.md, _PYQ-ROUTING-PRELIMS-2018-2023.md.

Answer-key rule: The official 2018-2023 Prelims/CSAT keys are not held locally; no option or answer has been inferred.

- **Years represented:** 2019, 2020, 2021, 2022
- **Paper(s):** GS-III, Prelims GS-I
- **Routed question demands:** 4

Year	Paper	Q	PYQ demand (neutral rendering)	Directive / format	Source status	Owner requirement
2019	GS-III	14	Government policy to address food processing sector challenges	Elaborate · 15 marks · 250 words	Routed to owning topic	Prepare context, core dimensions, evidence/examples, counterpoint and a concise conclusion.
2020	GS-III	4	Food processing sector challenges opportunities and farmer income	What are · 10 marks · 150 words	Routed to owning topic	Prepare context, core dimensions, evidence/examples, counterpoint and a concise conclusion.
2021	Prelims GS-I	52	Palm oil origin uses and biodiesel production	Objective question; official key unavailable locally	Cross-routed to palm-oil value-chain fundamentals and the NMEO-OP mission owner; key unavailable locally	Cover the named fact/concept and its likely statement-level distinctions.
2022	GS-III	4	Scope and significance of food processing industry in India	Elaborate · 10 marks · 150 words	Routed to owning topic	Prepare context, core dimensions, evidence/examples, counterpoint and a concise conclusion.

What this owner must now support

- Government policy to address food processing sector challenges
- Food processing sector challenges opportunities and farmer income
- Palm oil origin uses and biodiesel production
- Scope and significance of food processing industry in India

The table integrates the examinable demand and paper metadata. It does not turn an unkeyed objective question into a solved answer, and it does not claim that lexical presence alone proves full conceptual sufficiency.

10. PYQ-based analytical application

- ANALYSIS: 2025 GS-III: Scope of food-processing industries and employment-generation measures.
- ANALYSIS: 2025 GS-III supply-chain question provides the upstream framework for processing answers.
- ANALYSIS: **PYQ answer engine:** scope-first-mile aggregation, processing, packaging, testing, storage, cold movement, branding, retail and exports; constraints-seasonality, throughput, finance, power, standards and fair contracts; employment-farm-adjacent, manufacturing and service nodes.

Historical PYQ Integration (2018-2023)

Status: Question-level PYQ demand is integrated into this owner. **Provenance:** Audited local official-paper routing ledgers: _PYQ-ROUTING-MAINS-GS3-GS4-2018-2023.md.

- **Years represented:** 2019, 2020, 2022
- **Paper(s):** GS-III
- **Routed question demands:** 3

Year	Paper	Q	PYQ demand (neutral rendering)	Directive / format	Source status	Owner requirement
2019	GS-III	14	Government policy to address food processing sector challenges	Elaborate · 15 marks · 250 words	Routed to owning topic	Prepare context, core dimensions, evidence/examples, counterpoint and a concise conclusion.
2020	GS-III	4	Food processing sector challenges opportunities and farmer income	What are · 10 marks · 150 words	Routed to owning topic	Prepare context, core dimensions, evidence/examples, counterpoint and a concise conclusion.
2022	GS-III	4	Scope and significance of food processing industry in India	Elaborate · 10 marks · 150 words	Routed to owning topic	Prepare context, core dimensions, evidence/examples, counterpoint and a concise conclusion.

What this owner must now support

- Government policy to address food processing sector challenges
- Food processing sector challenges opportunities and farmer income
- Scope and significance of food processing industry in India

The table integrates the examinable demand and paper metadata. It does not turn an unkeyed objective question into a solved answer, and it does not claim that lexical presence alone proves full conceptual sufficiency.

PYQ DEMAND CARD 1 - 2019 GS-III

Demand: Elaborate government policy for addressing food-processing-sector challenges.

Status: Verified routed Mains demand; original model solution, not an official answer.

Model solution: PM Kisan SAMPADA: Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline.

Integrated cold-chain nodes: An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity.

Operation Greens boundary: Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. **PLISFPI boundary:** The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursement and realised exports are different stages.

Mega Food Park model: The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. **Small-processor constraints:** Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. The answer therefore separates definition, mechanism, evidence and limitation, and does not infer an official model answer or objective key.

PYQ DEMAND CARD 2 - 2020 GS-III

Demand: Explain food-processing opportunities and challenges and their relation to farmer income.

Status: Verified routed Mains demand; original model solution, not an official answer.

Model solution: Food processing: Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. **Value addition:** Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. **Integrated cold-chain nodes:** An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. **Capacity utilisation:** Processing viability depends on

throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. **Backward and forward links:** Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. **Contract and margin distribution:** Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. The answer therefore separates definition, mechanism, evidence and limitation, and does not infer an official model answer or objective key.

PYQ DEMAND CARD 3 - 2022 GS-III

Demand: Elaborate the scope and significance of India's food-processing industry.

Status: Verified routed Mains demand; original model solution, not an official answer.

Model solution: Food processing: Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. **Cold chain:** A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. **Value addition:** Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. **Post-harvest management:** Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. **FSSAI and APEDA:** FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. **Employment nodes:** Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. The answer therefore separates definition, mechanism, evidence and limitation, and does not infer an official model answer or objective key.

PYQ DEMAND CARD 4 - 2025 GS-III

Demand: Examine the scope of food-processing industries and measures for employment generation.

Status: Verified routed Mains demand; original model solution, not an official answer.

Model solution: Food processing: Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. **Integrated cold-chain nodes:** An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. **Capacity utilisation:** Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. **Employment nodes:** Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. **Small-processor constraints:** Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. **Capacity versus value realised:** Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. The answer therefore separates definition, mechanism, evidence and limitation, and does not infer an official model answer or objective key.

ORIGINAL MAINS 1 - 10 MARKS

Question: Distinguish food processing, post-harvest management, cold chain and value addition. Answer in about 150 words.

Model thesis: Claim: Food processing. **Named evidence/example:** Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Cold chain. **Named evidence/example:** A cold chain is temperature-controlled handling and movement across linked

stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Value addition. **Named evidence/example:** Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Post-harvest management. **Named evidence/example:** Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source.

Claim -> named evidence -> analysis -> qualification:

- Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant.
- A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain.
- Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain.
- Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest.

Qualified conclusion: **Claim:** Food processing. **Named evidence/example:** Food processing transforms, preserves or packages food to change shelf life, form, safety, convenience or market value; the degree of processing must be stated where relevant. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Cold chain. **Named evidence/example:** A cold chain is temperature-controlled handling and movement across linked stages from first-mile cooling to consumption; a standalone warehouse is not a complete chain. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Value addition. **Named evidence/example:** Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Post-harvest management. **Named evidence/example:** Post-harvest management includes cleaning, sorting, grading, drying, storage, transport, processing and loss control after harvest. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source.

ORIGINAL MAINS 2 - 10 MARKS

Question: Explain the role of traceability in safe and export-ready food chains. Answer in about 150 words.

Model thesis: **Claim:** Traceability. **Named evidence/example:** Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** FSSAI and APEDA. **Named evidence/example:** FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Standards and SPS. **Named evidence/example:** Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source.

Claim -> named evidence -> analysis -> qualification:

- Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself.
- FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable.
- Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors.

Qualified conclusion: **Claim:** Traceability. **Named evidence/example:** Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** FSSAI and APEDA. **Named evidence/example:** FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Standards and SPS. **Named evidence/example:** Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source.

Question: Evaluate PM Kisan SAMPADA, Operation Greens and PLISFPI as distinct instruments. Answer in about 250 words.

Model thesis: **Claim:** PM Kisan SAMPADA. **Named evidence/example:** Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Operation Greens boundary. **Named evidence/example:** Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** PLISFPI boundary. **Named evidence/example:** The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source.

Claim -> named evidence -> analysis -> qualification:

- Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline.
- Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal.
- The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages.

Qualified conclusion: **Claim:** PM Kisan SAMPADA. **Named evidence/example:** Pradhan Mantri Kisan SAMPADA Yojana is an umbrella for food-processing and value-chain infrastructure; component status, eligibility and outlay require the applicable dated guideline. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Operation Greens boundary. **Named evidence/example:** Operation Greens links price stabilisation and value-chain support for specified perishables, but commodity coverage and assistance windows are status-sensitive and not universal. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** PLISFPI boundary. **Named evidence/example:** The Production Linked Incentive Scheme for Food Processing Industries links support to eligible incremental performance; approval, investment, incremental sales, disbursal and realised exports are different stages. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source.

ORIGINAL MAINS 4 - 15 MARKS

Question: Why does a Mega Food Park or cold store not prove a functioning value chain? Answer in about 250 words.

Model thesis: **Claim:** Integrated cold-chain nodes. **Named evidence/example:** An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Mega Food Park model. **Named evidence/example:** The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Capacity utilisation. **Named evidence/example:** Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Capacity versus value realised. **Named evidence/example:** Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source.

Claim -> named evidence -> analysis -> qualification:

- An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity.
- The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability.
- Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow.
- Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins.

Qualified conclusion: **Claim:** Integrated cold-chain nodes. **Named evidence/example:** An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Mega Food Park model. **Named evidence/example:** The Mega Food Park model links collection and primary-processing centres with common central infrastructure, but sanction or constructed capacity does not prove occupancy, throughput or commercial viability. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Capacity utilisation. **Named evidence/example:** Processing viability depends on throughput, seasonality, energy, logistics, working capital and capacity utilisation; installed capacity is a stock while actual processed output is a flow. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting

boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Capacity versus value realised. **Named evidence/example:** Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source.

ORIGINAL MAINS 5 - 20 MARKS

Question: Assess whether food processing can raise farmer income and rural employment. Answer in about 300 words.

Model thesis: Claim: Value addition. **Named evidence/example:** Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Backward and forward links. **Named evidence/example:** Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Contract and margin distribution. **Named evidence/example:** Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Employment nodes. **Named evidence/example:** Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Small-processor constraints. **Named evidence/example:** Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source.

Claim -> named evidence -> analysis -> qualification:

- Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain.
- Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports.
- Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers.
- Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately.

- Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists.

Qualified conclusion: Claim: Value addition. **Named evidence/example:** Value addition is an increase in utility or market value through grading, processing, packaging, branding or services; higher final price does not prove the farmer captured the gain. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Backward and forward links. **Named evidence/example:** Backward linkage connects processors with farm aggregation and quality supply, while forward linkage connects processed output with retail, institutional buyers and exports. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Contract and margin distribution. **Named evidence/example:** Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Employment nodes. **Named evidence/example:** Food processing creates work in aggregation, grading, cold logistics, factories, packaging, testing, maintenance and retail, but job quality, formality and seasonality must be assessed separately. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Small-processor constraints. **Named evidence/example:** Micro and small processors can face working-capital, technology, testing, formalisation, power and market-access barriers even when local demand exists. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source.

ORIGINAL MAINS 6 - 20 MARKS

Question: Design a competitive, safe and resource-efficient food-processing chain for India. Answer in about 300 words.

Model thesis: Claim: Traceability. **Named evidence/example:** Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Integrated cold-chain nodes. **Named evidence/example:** An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** FSSAI and APEDA. **Named evidence/example:** FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Standards and SPS. **Named evidence/example:**

Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Contract and margin distribution. **Named evidence/example:** Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** By-product use. **Named evidence/example:** Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Capacity versus value realised. **Named evidence/example:** Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source.

Claim -> named evidence -> analysis -> qualification:

- Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself.
- An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity.
- FSSAI regulates domestic food-safety standards within its mandate, while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable.
- Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors.
- Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers.
- Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets.
- Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins.

Qualified conclusion: **Claim:** Traceability. **Named evidence/example:** Traceability tracks origin, processing and movement through the chain and supports recall, quality assurance and export compliance; it is not the same as food-safety regulation itself. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Integrated cold-chain nodes. **Named evidence/example:** An effective cold chain can require pack houses, pre-cooling, controlled storage, reefer transport, processing interfaces and reliable power; capacity at one node cannot substitute for continuity. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** FSSAI and APEDA. **Named evidence/example:** FSSAI regulates domestic food-safety standards within its mandate,

while APEDA supports agricultural and processed-food export development and market access; their functions are not interchangeable. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Standards and SPS. **Named evidence/example:** Testing, sanitary and phytosanitary requirements, quality certification and traceability can unlock premium markets while imposing fixed compliance costs on small processors. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Contract and margin distribution. **Named evidence/example:** Contracts allocate quantity, quality, price, rejection and force-majeure risk; competition and farmer aggregation determine whether additional value reaches primary producers. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** By-product use. **Named evidence/example:** Processing by-products can support feed, compost, energy and other circular-bioeconomy uses, but commercial value depends on segregation, safety, technology and markets. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source. **Claim:** Capacity versus value realised. **Named evidence/example:** Cold-chain or plant capacity measures an installed stock, actual throughput measures use, and realised value addition depends on output quality, price, cost and distribution of margins. **Analysis:** This identifies the economic mechanism, the relevant institution or accounting boundary, and the effect on output, prices, distribution or financial stability. **Qualification:** The conclusion must retain the stated period, estimate vintage, base year, basket, instrument eligibility, crop and geography scope, implementation stage, stock-flow distinction or legal perimeter rather than generalise beyond the source.
